

Synchronization: Advanced

15-213 / 18-213: Introduction to Computer Systems
25th Lecture, April 23, 2012

Instructors:

Seth Copen Goldstein, Anthony Rowe, and Greg Kesden

1

Today

- Races
- Locking and Deadlocks
- Producer-consumer problem
- Readers-writers problem
- Thread safety

2

One Worry: Races

- A *race* occurs when correctness of the program depends on one thread reaching point x before another thread reaches point y

```
/* a threaded program with a race */
int main() {
    pthread_t tid[N];
    int i;
    for (i = 0; i < N; i++)
        Pthread_create(&tid[i], NULL, thread, &i);
    for (i = 0; i < N; i++)
        Pthread_join(tid[i], NULL);
    exit(0);
}

/* thread routine */
void *thread(void *vargp) {
    int myid = *((int *)vargp);
    printf("Hello from thread %d\n", myid);
    return NULL;
}
```

race.c

3

Race Elimination

- Make sure don't have unintended sharing of state

```
/* a threaded program without the race */
int main() {
    pthread_t tid[N];
    int i;
    for (i = 0; i < N; i++) {
        int *valp = malloc(sizeof(int));
        *valp = i;
        Pthread_create(&tid[i], NULL, thread, valp);
    }
    for (i = 0; i < N; i++)
        Pthread_join(tid[i], NULL);
    exit(0);
}

/* thread routine */
void *thread(void *vargp) {
    int myid = *((int *)vargp);
    free(vargp);
    printf("Hello from thread %d\n", myid);
    return NULL;
}
```

norace.c

- Readers-writers problem
- Thread safety

5

Reminder: Semaphores

- **Semaphore:** non-negative global integer synchronization variable
- **Manipulated by P and V operations:**
 - $P(s)$: [while ($s == 0$) wait(); $s--$;]
 - Dutch for "Proberen" (test)
 - $V(s)$: [$s++$;]
 - Dutch for "Verhogen" (increment)
- **OS kernel guarantees that operations between brackets [] are executed indivisibly**
 - Only one P or V operation at a time can modify s .
 - When **while** loop in P terminates, only that P can decrement s
- **Semaphore invariant: ($s \geq 0$)**

6

Reminder: Mutual exclusion via Semaphores

- **Basic idea:**
 - Associate a unique semaphore *mutex*, initially 1, with each shared variable (or related set of shared variables)
 - Surround corresponding critical sections with $P(mutex)$ and $V(mutex)$ operations
- **Terminology:**
 - **Binary semaphore:** semaphore whose value is always 0 or 1
 - **Mutex:** binary semaphore used for mutual exclusion
 - P operation: "locking" the mutex
 - V operation: "unlocking" or "releasing" the mutex
 - "Holding" a mutex: locked and not yet unlocked
 - **Counting semaphore:** used as a counter for set of available resources

7

A Worry: Deadlock

- **Def:** A process is **deadlocked** iff it is waiting for a condition that will never be true.
- **Typical Scenario**
 - Processes 1 and 2 needs two resources (A and B) to proceed
 - Process 1 acquires A, waits for B
 - Process 2 acquires B, waits for A
 - Both will wait forever!

8

Deadlocking With Semaphores

```
int main()
{
    pthread_t tid[2];
    Sem_init(&mutex[0], 0, 1); /* mutex[0] = 1 */
    Sem_init(&mutex[1], 0, 1); /* mutex[1] = 1 */
    Pthread_create(&tid[0], NULL, count, (void*) 0);
    Pthread_create(&tid[1], NULL, count, (void*) 1);
    Pthread_join(tid[0], NULL);
    Pthread_join(tid[1], NULL);
    printf("cnt=%d\n", cnt);
    exit(0);
}
```

```
void *count(void *vargp)
{
    int i;
    int id = (int) vargp;
    for (i = 0; i < NITERS; i++) {
        P(&mutex[id]); P(&mutex[1-id]);
        cnt++;
        V(&mutex[id]); V(&mutex[1-id]);
    }
    return NULL;
}
```

Tid[0]:
P(s₀);
P(s₁);
cnt++;
V(s₀);
V(s₁);

Tid[1]:
P(s₁);
P(s₀);
cnt++;
V(s₁);
V(s₀);

9

Deadlock Visualized in Progress Graph

Locking introduces the potential for **deadlock**: waiting for a condition that will never be true

Any trajectory that enters the **deadlock region** will eventually reach the **deadlock state**, waiting for either S_0 or S_1 to become nonzero

Other trajectories luck out and skirt the deadlock region

Unfortunate fact: deadlock is often nondeterministic (race)

10

Avoiding Deadlock

Acquire shared resources in same order

```
int main()
{
    pthread_t tid[2];
    Sem_init(&mutex[0], 0, 1); /* mutex[0] = 1 */
    Sem_init(&mutex[1], 0, 1); /* mutex[1] = 1 */
    Pthread_create(&tid[0], NULL, count, (void*) 0);
    Pthread_create(&tid[1], NULL, count, (void*) 1);
    Pthread_join(tid[0], NULL);
    Pthread_join(tid[1], NULL);
    printf("cnt=%d\n", cnt);
    exit(0);
}
```

```
void *count(void *vargp)
{
    int i;
    int id = (int) vargp;
    for (i = 0; i < NITERS; i++) {
        P(&mutex[0]); P(&mutex[1]);
        cnt++;
        V(&mutex[id]); V(&mutex[1-id]);
    }
    return NULL;
}
```

Tid[0]:
P(s₀);
P(s₁);
cnt++;
V(s₀);
V(s₁);

Tid[1]:
P(s₀);
P(s₁);
cnt++;
V(s₁);
V(s₀);

11

Avoided Deadlock in Progress Graph

No way for trajectory to get stuck

Processes acquire locks in same order

Order in which locks released immaterial

12

Today

- Races
- Deadlocks
- **Producer-consumer problem**
- Readers-writers problem
- Thread safety

13

Using Semaphores to Coordinate Access to Shared Resources

- **Basic idea:** Thread uses a semaphore operation to notify another thread that some condition has become true
 - Use counting semaphores to keep track of resource state.
 - Use binary semaphores to notify other threads.
- **Two classic examples:**
 - The Producer-Consumer Problem
 - The Readers-Writers Problem

14

Producer-Consumer Problem

- **Common synchronization pattern:**
 - Producer waits for empty *slot*, inserts item in buffer, and notifies consumer
 - Consumer waits for *item*, removes it from buffer, and notifies producer
- **Examples**
 - Multimedia processing:
 - Producer creates MPEG video frames, consumer renders them
 - Event-driven graphical user interfaces
 - Producer detects mouse clicks, mouse movements, and keyboard hits and inserts corresponding events in buffer
 - Consumer retrieves events from buffer and paints the display

15

Producer-Consumer on 1-element Buffer

```

#include "csapp.h"

#define NITERS 5

void *producer(void *arg);
void *consumer(void *arg);

struct {
    int buf; /* shared var */
    sem_t full; /* sems */
    sem_t empty;
} shared;
  
```

```

int main() {
    pthread_t tid_producer;
    pthread_t tid_consumer;

    /* Initialize the semaphores */
    Sem_init(&shared.empty, 0, 1);
    Sem_init(&shared.full, 0, 0);

    /* Create threads and wait */
    Pthread_create(&tid_producer, NULL,
                  producer, NULL);
    Pthread_create(&tid_consumer, NULL,
                  consumer, NULL);
    Pthread_join(tid_producer, NULL);
    Pthread_join(tid_consumer, NULL);

    exit(0);
}
  
```

16

Producer-Consumer on 1-element Buffer

Initially: empty==1, full==0

Producer Thread

```
void *producer(void *arg) {
    int i, item;

    for (i=0; i<NITERS; i++) {
        /* Produce item */
        item = i;
        printf("produced %d\n",
            item);

        /* Write item to buf */
        P(&shared.empty);
        shared.buf = item;
        V(&shared.full);
    }
    return NULL;
}
```

Consumer Thread

```
void *consumer(void *arg) {
    int i, item;

    for (i=0; i<NITERS; i++) {
        /* Read item from buf */
        P(&shared.full);
        item = shared.buf;
        V(&shared.empty);

        /* Consume item */
        printf("consumed %d\n", item);
    }
    return NULL;
}
```

17

Counting with Semaphores

- Remember, it's a non-negative integer
 - So, values greater than 1 are legal
- Lets repeat thing_5() 5 times for every 3 of thing_3()

```
/* thing_5 and thing_3 */
#include "csapp.h"

sem_t five;
sem_t three;

void *five_times(void *arg);
void *three_times(void *arg);
```

```
int main() {
    pthread_t tid_five, tid_three;

    /* initialize the semaphores */
    Sem_init(&five, 0, 5);
    Sem_init(&three, 0, 3);

    /* create threads and wait */
    Pthread_create(&tid_five, NULL,
        five_times, NULL);
    Pthread_create(&tid_three, NULL,
        three_times, NULL);

    .
    .
    .
}
```

18

Counting with semaphores (cont)

Initially: five = 5, three = 3

```
/* thing_5() thread */
void *five_times(void *arg) {
    int i;

    while (1) {
        for (i=0; i<5; i++) {
            /* wait & thing_5() */
            P(&five);
            thing_5();
        }
        V(&three);
        V(&three);
        V(&three);
    }
    return NULL;
}
```

```
/* thing_3() thread */
void *three_times(void *arg) {
    int i;

    while (1) {
        for (i=0; i<3; i++) {
            /* wait & thing_3() */
            P(&three);
            thing_3();
        }
        V(&five);
        V(&five);
        V(&five);
        V(&five);
        V(&five);
    }
    return NULL;
}
```

19

Producer-Consumer on an n -element Buffer

- Requires a mutex and two counting semaphores:
 - mutex: enforces mutually exclusive access to the the buffer
 - slots: counts the available slots in the buffer
 - items: counts the available items in the buffer
- Implemented using a shared buffer package called sbuf.

20

sbuf Package - Declarations

```
#include "csapp.h"

typedef struct {
    int *buf;          /* Buffer array */
    int n;              /* Maximum number of slots */
    int front;          /* buf[(front+1)%n] is first item */
    int rear;           /* buf[rear%n] is last item */
    sem_t mutex;        /* Protects accesses to buf */
    sem_t slots;        /* Counts available slots */
    sem_t items;        /* Counts available items */
} sbuf_t;

void sbuf_init(sbuf_t *sp, int n);
void sbuf_deinit(sbuf_t *sp);
void sbuf_insert(sbuf_t *sp, int item);
int sbuf_remove(sbuf_t *sp);
```

sbuf.h

21

sbuf Package - Implementation

Initializing and deinitializing a shared buffer:

```
/* Create an empty, bounded, shared FIFO buffer with n slots */
void sbuf_init(sbuf_t *sp, int n)
{
    sp->buf = Calloc(n, sizeof(int));
    sp->n = n;          /* Buffer holds max of n items */
    sp->front = sp->rear = 0; /* Empty buffer iff front == rear */
    Sem_init(&sp->mutex, 0, 1); /* Binary semaphore for locking */
    Sem_init(&sp->slots, 0, n); /* Initially, buf has n empty slots */
    Sem_init(&sp->items, 0, 0); /* Initially, buf has zero items */
}

/* Clean up buffer sp */
void sbuf_deinit(sbuf_t *sp)
{
    Free(sp->buf);
}
```

sbuf.c

22

sbuf Package - Implementation

Inserting an item into a shared buffer:

```
/* Insert item onto the rear of shared buffer sp */
void sbuf_insert(sbuf_t *sp, int item)
{
    P(&sp->slots);          /* Wait for available slot */
    P(&sp->mutex);           /* Lock the buffer */
    sp->buf[(++sp->rear)%(sp->n)] = item; /* Insert the item */
    V(&sp->mutex);          /* Unlock the buffer */
    V(&sp->items);          /* Announce available item */
}
```

sbuf.c

23

sbuf Package - Implementation

Removing an item from a shared buffer:

```
/* Remove and return the first item from buffer sp */
int sbuf_remove(sbuf_t *sp)
{
    int item;

    P(&sp->items);          /* Wait for available item */
    P(&sp->mutex);           /* Lock the buffer */
    item = sp->buf[(++sp->front)%(sp->n)]; /* Remove the item */
    V(&sp->mutex);          /* Unlock the buffer */
    V(&sp->slots);          /* Announce available slot */
    return item;
}
```

sbuf.c

24

Sample program using sbuf

<pre>void * producer(void *vargp) { int cnt = 0; while (maxcnt > 0) { sbuf_insert(&sbuf, cnt); cnt++; maxcnt--; } sbuf_insert(&sbuf, -1); pthread_exit(0); }</pre>	<pre>void * consumer(void *vargp) { int sum = 0; while (1) { int val = sbuf_remove(&sbuf); if (val < 0) break; sum += val; } total = sum; pthread_exit(0); }</pre>
---	---

25

Is there another way?

■ One producer and one consumer

```
/* Insert item onto the rear of shared buffer sp */
void sbuf_insert(sbuf_t *sp, int item)
{
    P(&sp->slots); /* Wait for available slot */
P(&sp->mutex); /* Lock the buffer */
    sp->buf[(++sp->rear)%(sp->n)] = item; /* Insert the item */
V(&sp->mutex); /* Unlock the buffer */
    V(&sp->items); /* Announce available item */
}

/* Remove and return the first item from buffer sp */
int sbuf_remove(sbuf_t *sp)
{
    int item;

    P(&sp->items); /* Wait for available item */
P(&sp->mutex); /* Lock the buffer */
    item = sp->buf[(++sp->front)%(sp->n)]; /* Remove the item */
V(&sp->mutex); /* Unlock the buffer */
    V(&sp->slots); /* Announce available slot */
    return item;
}
```

Do we need locks at all?

```
/* Insert item onto the rear of shared buffer sp */
void sbuf_insert(sbuf_t *sp, int item)
{
    P(&sp->slots); /* Wait for available slot */

    sp->buf[(++sp->rear)%(sp->n)] = item; /* Insert the item */

    V(&sp->items); /* Announce available item */
}

/* Remove and return the first item from buffer sp */
int sbuf_remove(sbuf_t *sp)
{
    int item;

    P(&sp->items); /* Wait for available item */

    item = sp->buf[(++sp->front)%(sp->n)]; /* Remove the item */

    V(&sp->slots); /* Announce available slot */
    return item;
}
```

Front and rear are not (really) shared!

```
typedef struct {
    int *buf;
    int n;
    int front;
    int rear;
    int cnt;
} sbuf_t;

void
sbuf_init(sbuf_t *sp, int n) {
    sp->n = n;
    sp->buf = calloc(sizeof(int), n);
    sp->front = 0;
    sp->rear = 0;
    sp->cnt = 0;
}
```

28

Front and rear are not (really) shared!

```
void
sbuf_insert(sbuf_t* sp, int v)
{
    int next = sp->rear+1;
    if (next == sp->n)
        next = 0;
    while (next == sp->front)
        pthread_yield();
    sp->buf[sp->rear] = v;
    sp->rear = next;
}
```

```
int
sbuf_remove(sbuf_t* sp)
{
    while (sp->front == sp->rear)
        pthread_yield();
    int next = sp->front+1;
    if (next == sp->n) next = 0;
    int val = sp->buf[sp->front];
    sp->front = next;
    return val;
}
```

29

Front and rear are not (really) shared!

```
void
sbuf_insert(sbuf_t* sp, int v)
{
    int next = sp->rear+1;
    if (next == sp->n)
        next = 0;
    while (next == sp->front)
        pthread_yield();
    sp->buf[sp->rear] = v;
    sp->rear = next;
}
```

```
int
sbuf_remove(sbuf_t* sp)
{
    while (sp->front == sp->rear)
        pthread_yield();
    int next = sp->front+1;
    if (next == sp->n) next = 0;
    int val = sp->buf[sp->front];
    sp->front = next;
    return val;
}
```

30

Front and rear are not (really) shared!

```
void
sbuf_insert(sbuf_t* sp, int v)
{
    int next = sp->rear+1;
    if (next == sp->n)
        next = 0;
    while (next == sp->front)
        pthread_yield();
    sp->buf[sp->rear] = v;
    sp->rear = next;
}
```

```
int
sbuf_remove(sbuf_t* sp)
{
    while (sp->front == sp->rear)
        pthread_yield();
    int next = sp->front+1;
    if (next == sp->n) next = 0;
    int val = sp->buf[sp->front];
    sp->front = next;
    return val;
}
```

Why does this work for
ONLY 1 producer and 1
consumer?

31

Front and rear are **really** shared!

```
void
sbuf_insert(sbuf_t* sp, int v)
{
    int next = sp->rear+1;
    if (next == sp->n)
        next = 0;
    while (next == sp->front)
        pthread_yield();
    sp->buf[sp->rear] = v;
    sp->rear = next;
}
```

```
int
sbuf_remove(sbuf_t* sp)
{
    while (sp->front == sp->rear)
        pthread_yield();
    int next = sp->front+1;
    if (next == sp->n) next = 0;
    int val = sp->buf[sp->front];
    sp->front = next;
    return val;
}
```

Why does this work for
ONLY 1 producer and 1
consumer?

32

Timing

33

Today

- Races
- Deadlocks
- Producer-consumer problem
- Readers-writers problem
- Thread safety

34

Readers-Writers Problem

- Generalization of the mutual exclusion problem
- Problem statement:
 - Reader threads only read the object
 - Writer threads modify the object
 - Writers must have exclusive access to the object
 - Unlimited number of readers can access the object
- Occurs frequently in real systems, e.g.,
 - Online airline reservation system
 - Multithreaded caching Web proxy

35

Variants of Readers-Writers

- **First readers-writers problem (favors readers)**
 - No reader should be kept waiting unless a writer has already been granted permission to use the object.
 - A reader that arrives after a waiting writer gets priority over the writer.
- **Second readers-writers problem (favors writers)**
 - Once a writer is ready to write, it performs its write as soon as possible
 - A reader that arrives after a writer must wait, even if the writer is also waiting.
- **Starvation (where a thread waits indefinitely) is possible in both cases.**

36

Solution to First Readers-Writers Problem

Readers:

```
int readcnt; /* Initially 0 */
sem_t mutex, w; /* Both initially 1 */

void reader(void)
{
    while (1) {
        P(&mutex);
        readcnt++;
        if (readcnt == 1) /* First in */
            P(&w);
        V(&mutex);

        /* Reading happens here */

        P(&mutex);
        readcnt--;
        if (readcnt == 0) /* Last out */
            V(&w);
        V(&mutex);
    }
}
```

Writers:

```
void writer(void)
{
    while (1) {
        P(&w);

        /* Writing here */

        V(&w);
    }
}
```

rw1.c

37

Today

- Races
- Deadlocks
- Producer-consumer problem
- Readers-writers problem
- Thread safety

38

Crucial concept: Thread Safety

- Functions called from a thread must be *thread-safe*
- **Def:** A function is *thread-safe* iff it will always produce correct results when called repeatedly from multiple concurrent threads.
- **Classes of thread-unsafe functions:**
 - Class 1: Functions that do not protect shared variables
 - Class 2: Functions that keep state across multiple invocations
 - Class 3: Functions that return a pointer to a static variable
 - Class 4: Functions that call thread-unsafe functions

39

Thread-Unsafe Functions (Class 1)

- **Failing to protect shared variables**
 - Fix: Use *P* and *V* semaphore operations
 - Example: `goodcnt.c`
 - Issue: Synchronization operations will slow down code

40

Thread-Unsafe Functions (Class 2)

- Relying on persistent state across multiple function invocations
 - Example: Random number generator that relies on static state

```
static unsigned int next = 1;

/* rand: return pseudo-random integer on 0..32767 */
int rand(void)
{
    next = next*1103515245 + 12345;
    return (unsigned int)(next/65536) % 32768;
}

/* srand: set seed for rand() */
void srand(unsigned int seed)
{
    next = seed;
}
```

41

Thread-Safe Random Number Generator

- Pass state as part of argument
 - and, thereby, eliminate static state

```
/* rand_r - return pseudo-random integer on 0..32767 */

int rand_r(int *nextp)
{
    *nextp = *nextp*1103515245 + 12345;
    return (unsigned int)(*nextp/65536) % 32768;
}
```

- Consequence: programmer using `rand_r` must maintain seed

42

Thread-Unsafe Functions (Class 3)

- Returning a pointer to a static variable
- Fix 1. Rewrite function so caller passes address of variable to store result
 - Requires changes in caller and callee
- Fix 2. Lock-and-copy
 - Requires simple changes in caller (and none in callee)
 - However, caller must free memory.

```
/* lock-and-copy version */
char *ctime_ts(const time_t *timep,
               char *privatep)
{
    char *sharedp;

    P(&mutex);
    sharedp = ctime(timep);
    strcpy(privatep, sharedp);
    V(&mutex);
    return privatep;
}
```

Warning: Some functions like `gethostbyname` require a *deep copy*. Use reentrant `gethostbyname_r` version instead.

43

Thread-Unsafe Functions (Class 4)

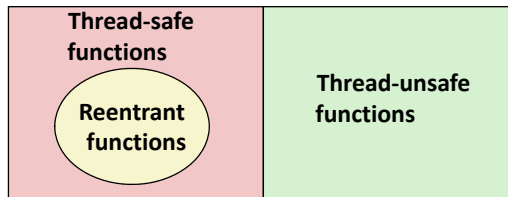

- Calling thread-unsafe functions
 - Calling one thread-unsafe function makes the entire function that calls it thread-unsafe
 - Fix: Modify the function so it calls only thread-safe functions ☺

44

Reentrant Functions

- Def: A function is *reentrant* iff it accesses no shared variables when called by multiple threads.
 - Important subset of thread-safe functions
 - Require no synchronization operations
 - Only way to make a Class 2 function thread-safe is to make it reentrant (e.g., `rand_r`)

All functions

45

Thread-Safe Library Functions

- All functions in the Standard C Library (at the back of your K&R text) are thread-safe
 - Examples: `malloc`, `free`, `printf`, `scanf`
- Most Unix system calls are thread-safe, with a few exceptions:

Thread-unsafe function	Class	Reentrant version
<code>asctime</code>	3	<code>asctime_r</code>
<code>ctime</code>	3	<code>ctime_r</code>
<code>gethostbyaddr</code>	3	<code>gethostbyaddr_r</code>
<code>gethostbyname</code>	3	<code>gethostbyname_r</code>
<code>inet_ntoa</code>	3	(none)
<code>localtime</code>	3	<code>localtime_r</code>
<code>rand</code>	2	<code>rand_r</code>

46

Threads Summary

- Threads provide another mechanism for writing concurrent programs
- Threads are growing in popularity
 - Somewhat cheaper than processes
 - Easy to share data between threads
- However, the ease of sharing has a cost:
 - Easy to introduce subtle synchronization errors
 - Tread carefully with threads!
- For more info:
 - D. Butenhof, "Programming with Posix Threads", Addison-Wesley, 1997

Case Study: Prethreaded Concurrent Server

48

Prethreaded Concurrent Server

```

sbuf_t sbuf; /* Shared buffer of connected descriptors */

int main(int argc, char **argv)
{
    int i, listenfd, connfd, port;
    socklen_t clientlen=sizeof(struct sockaddr_in);
    struct sockaddr_in clientaddr;
    pthread_t tid;

    port = atoi(argv[1]);
    sbuf_init(&sbuf, SBUFSIZE);
    listenfd = Open_listenfd(port);

    for (i = 0; i < NTHREADS; i++) /* Create worker threads */
        Pthread_create(&tid, NULL, thread, NULL);

    while (1) {
        connfd = Accept(listenfd, (SA *) &clientaddr, &clientlen);
        sbuf_insert(&sbuf, connfd); /* Insert connfd in buffer */
    }
}

```

echoservt_pre.c 49

Prethreaded Concurrent Server

Worker thread routine:

```

void *thread(void *vargp)
{
    Pthread_detach(pthread_self());
    while (1) {
        int connfd = sbuf_remove(&sbuf); /* Remove connfd from
                                          buffer */
        echo_cnt(connfd);                /* Service client */
        Close(connfd);
    }
}

```

echoservt_pre.c

50

Prethreaded Concurrent Server

echo_cnt initialization routine:

```

static int byte_cnt; /* Byte counter */
static sem_t mutex; /* and the mutex that protects it */

static void init_echo_cnt(void)
{
    Sem_init(&mutex, 0, 1);
    byte_cnt = 0;
}

```

echo_cnt.c

51

Prethreaded Concurrent Server

Worker thread service routine:

```

void echo_cnt(int connfd)
{
    int n;
    char buf[MAXLINE];
    rio_t rio;
    static pthread_once_t once = PTHREAD_ONCE_INIT;

    Pthread_once(&once, init_echo_cnt);
    Rio_readinitb(&rio, connfd);
    while((n = Rio_readlineb(&rio, buf, MAXLINE)) != 0) {
        P(&mutex);
        byte_cnt += n;
        printf("thread %d received %d (%d total) bytes on fd
%d\n",
              (int) pthread_self(), n, byte_cnt, connfd);
        V(&mutex);
        Rio_writen(connfd, buf, n);
    }
}

```

echo_cnt.c
