

Microsoft Presents:

Tech Talk

Windows Azure and Microsoft's Cloud

Monday, 10/3

6:00- 7:00pm

Rashid Auditorium

Presented by Devon Yang- CMU Alum

Window's Azure Software Development Engineer

As computing devices diverge across form factors and interfaces, the increased reliance on the cloud becomes much more apparent. It is no longer practical to use local storage on devices as a primary means of storing applications and data. As a result, today's applications are moving to become completely web-based, where the only client requirement is a web browser.

Windows Azure provides a robust platform that can be used by developers to facilitate the development of a web application without having to worry about owning or configuring any infrastructure. This talk will capture the details of what services the Windows Azure platform provides to developers as well as an overview of the internal architecture of the Windows Azure Compute service, which is responsible for the management of a web service's lifecycle.
