

These problems were generated by TAs and instructors in previous semesters. They may or may not match the actual difficulty of problems on Quiz1.

Algorithms and Abstraction

1. As you learned in lecture, computer science boils down to two main ideas: algorithms and abstraction.
 - 1) Identify/Define the difference between algorithms and abstraction, and provide an example for each.
 - 2) What are the 3 key components of a good algorithm?

Programming Basics

1. For each of the following Python expressions, identify the data type of the value it will evaluate to.
 - 1) 3
 - 2) 3.0
 - 3) "3"
 - 4) 3 < 3
 - 5) "3" + "3"
 - 6) 3.0 * 3.0
 - 7) 3 / 3
2. Suppose you are creating a few variables to describe yourself or another person. Name the data type that would **best** fit each variable description:
 - 1) Name
 - 2) Age
 - 3) Height (inches)
 - 4) Ability to vote
 - 5) Address
 - 6) Zip code
 - 7) Weight
 - 8) School you attend
 - 9) Ability to speak more than one language

Data Representation

1. Answer the following questions regarding number systems:
 - 1) What is a number system?
 - 2) How many values can a specific digit have in a decimal number? In a binary number?
 - 3) Let's say that we are representing length in imperial units. You are given inches, feet, and yards. How could you represent 10,000 inches in this system (show your work)? (hint: 12 inches=foot, 3 feet=yard 1760 feet=mile)
2. Complete the following conversions and show appropriate work:
 - 1) Convert 10111011 from binary to decimal
 - 2) Convert 11111111 from binary to decimal
 - 3) Convert 01101110 from binary to decimal
 - 4) Convert 57 from decimal to 8-bit binary
 - 5) Convert 63 from decimal to 8-bit binary
 - 6) Convert 88 from decimal to 8-bit binary
3. The following questions relate to interpreting binary numbers as abstracted types
 - 1) Answer the following questions relating to abstracting colors:
 - a) How many bytes are needed to represent an RGB value?
 - b) What are the highest and lowest values for any color?
 - c) Convert the color purple to an RGB value. Provide the values in decimal and binary.
 - d) Convert 11010101 11110000 00110011 to a color (You can use this link to determine what color is appears to be:
https://www.w3schools.com/colors/colors_rgb.asp)
 - 2) Answer the following questions relating to abstracting text (ASCII table:
<http://www.asciitable.com/>):
 - a) Convert 00111010 00101001 to ASCII characters.
 - b) Convert 'CMU cmu' into 8-bit binary (neglect the quotation marks).

Functions (Calls and Definitions)

1. Evaluate the print statements and state what the value of y and x are at the end of the function.

```
x = 15+1
```

```
def f():  
    y = 12  
    print(y * 2)  
    print(y)  
    y = "apple"  
    print("bananas, 15-110, and",y)  
    print(x+3)
```

```
f()
```

2. Consider the following function:

```
def helloThere(name):  
    print("Hello there,", name, "!")
```

- 1) What will you see in the shell if you call `print(helloThere("Stella"))` ?
- 2) Does this function have side effect(s)? If so, state the side effect(s).
- 3) Does this function have a returned value? If so, state the returned value.
- 4) What do we call the statement `helloThere("Stella")`? What do we call the string "Stella" in that statement?

3. Consider the following algorithm for a function:

Algorithm:

1. Input a number n
2. If n is greater than or equal to 0 do the following, otherwise skip to step 3:
 - a. If n is divisible by 10 then print out the value of n followed by " is cool number", otherwise skip to step 2b
 - b. If step 2a did not occur, check if n is divisible by 4, and if so print out the value of n followed by " is a strange number", otherwise skip to step 2c
 - c. Skip to step 4
3. Print the value of n followed by " is a negative number!!"
4. Print the string "ALL DONE"

Identify the argument(s), returned value, and side effect(s) of this algorithm. Then write the corresponding Python function called `divisionCheck`.

4. The function `fruitCalculator` has parameters `percentApples`, `totalFruit`, and `farm`. `fruitCalculator` calculates the number of apples harvested by the farm, prints the number of apples and the number of other fruit, and returns a string announcing the harvest of apples. For example, `fruitCalculator(0.75, 400, "Carnegie Farms")` would return "Carnegie Farms harvested 300 apples this year", and the following would be printed in the console.

```
300 apples were harvested!  
100 other fruits were also harvested!
```

Write the function `fruitCalculator` according to the description above.

5. Suppose we had the following segment of code:

```
course = "15110"  
grade = 95.0  
def randomFunction(x, y):  
    sum = x + y  
    difference = x - y  
    print(course)  
    return (sum + difference) / 2
```

Give the scopes, either local or global, of the following variables: `course`, `grade`, `sum`, `x`, `y`, and `difference`.
