

UNIT 6A Organizing Data

Announcements

 We will be splitting the first lecture into two groups for the exam. My slides from last week has the exact information about who needs to go where for the exam.

- 2:30 Exam:

- Sections A, B, C, D, E go to Rashid (GHC 4401)
- Sections F, G go to PH 125C.

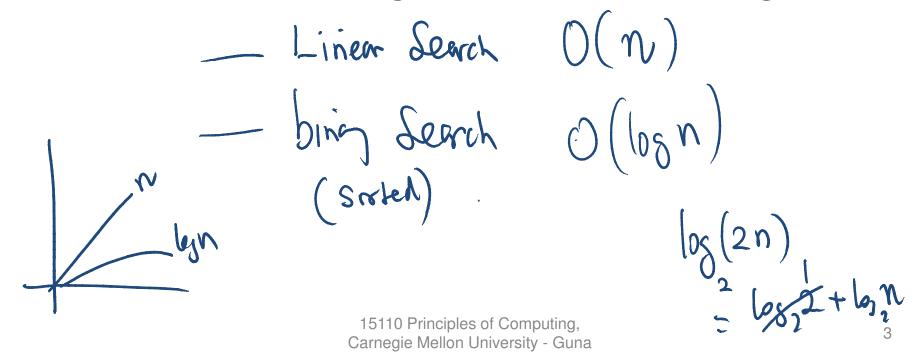

- 3:30 Exam:

- Sections H, I, J, K, L, M, N all go to Rashid (GHC 4401).
- Bring your CMU id!
- People who need extended time should confirm their arrangements with Dilsun
 - dilsun@cs.cmu.edu

Arrapo for white Nesked if Recursion functions Searching Swring Big O

Data Explosion

- The data on Internet doubles every 6 months
- Challenge is store the data so they can be searched easily
- What are some algorithms for searching data?

Data Processing Challenges

- Sort million records in a fraction of a second
- Build a relationship graph from a known set of relationship pairs
- Find the shortest distance from A to B
- Find all people who are in proximity to me
- What are some others?

How are data stored to meet these challenges

How is data processed?

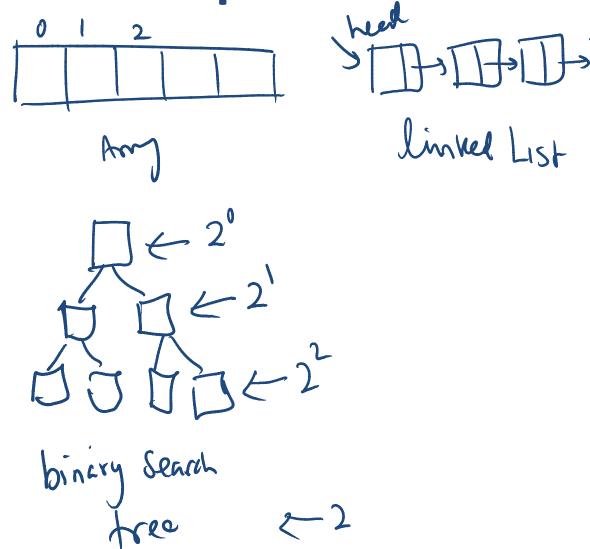

Data Structures

A data structure is a way of storing data in a computer so that it can be used efficiently.

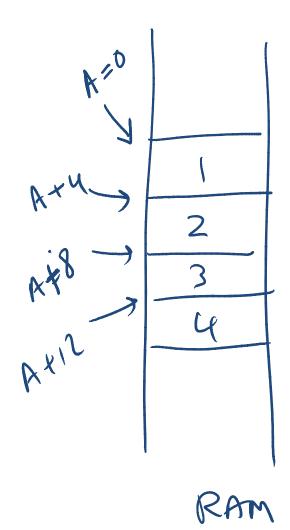

- Choosing the right data structure will allow us to develop certain algorithms for that data that are more efficient.
- An array (or list) is a very simple data structure for holding a sequence of data.

Examples of data structures

How Arrays are stored in memory

Arrays: Pros and Cons

• Pros:

 Access to an array element is fast since we can compute its location quickly.

Cons:

- If we want to insert or delete an element, we have to shift subsequent elements which slows our computation down.
- We need a large enough block of memory to hold our array.

Array operations

Finding length

$$A = [1234]$$
 $A < < 5$

Removing an element

- Array.delete_at(array.index(elem))

A. delet-at(1)

[1345]

Array operations

lish

Merging two arrays

Sorting an array

Selecti Soft O(n2) for i in O. listlatengh-1

$$C = []$$

156

Searching an array

Swapping two elements

$$C << list[Li]$$

$$(n = list.lyh)$$

$$tmp = A(0)$$

$$A(0) = A(n-1)$$

$$A(n-1) = tmp$$

15110 Principles of Computing, Carnegie Mellon University - GUNA

Merge two arrays

def merge(list1, list2)

Sub arrays

def subarray(list, start, end)

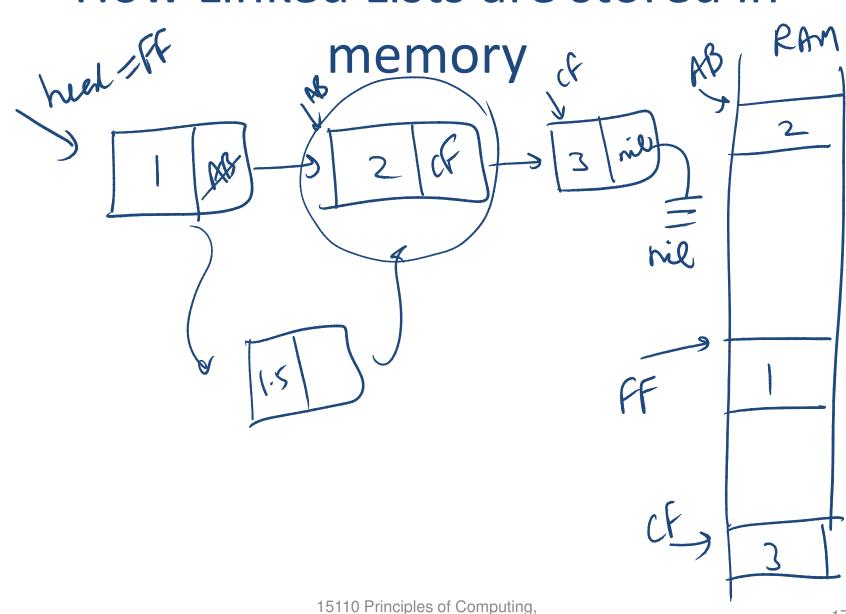

end

This returns a subarray from start to end

Linked Lists

- Another data structure that stores a sequence of data values is called the linked list.
- Data values in a linked list do not have to be stored in adjacent memory cells.
- To accommodate this feature, each data value has an additional "pointer" that indicates where the next data value is in computer memory.
- In order to use the linked list, we only need to know where the first data value is stored.

How Linked Lists are stored in

15110 Principles of Computing, Carnegie Mellon University - GUNA

Linked List operations

Linked Lists: Pros and Cons

• Pros:

 Inserting and deleting data does not require us to move/shift subsequent data elements.

Cons:

- If we want to access a specific element, we need to traverse the list from the head of the list to find it which can take longer than an array access.
- Linked lists require more memory. (Why?)

Two-dimensional arrays

- Some data can be organized efficiently in a table (also called a matrix or 2-dimensional array)
- Each cell is denoted with two subscripts, a row and column indicator 38 + 50 B[2][3] = 50

2D Arrays in Ruby

data =
$$\begin{bmatrix} 1, 2, 3, 4 \end{bmatrix}$$
, $\begin{bmatrix} 5, 6, 7, 8 \end{bmatrix}$, $\begin{bmatrix} 9, 10, 11, 12 \end{bmatrix}$

	0	1	2	3
0	1	2	က	4
1	5	6	7	8
2	9	10	11	12

```
data[0] => [1, 2, 3, 4]
data[1][2] => 7
data[2][5] => nil
data[4][2] => undefined method '[]' for nil
```

2D Array Example in Ruby

Find the sum of all elements in a 2D array

```
def sumMatrix(table)
                               number of rows in the table
  sum = 0
  for row in 0..table.length-1 do
      for col in 0..table[row].length-1 do
            sum = sum + table[row][col]
      end
                                     number of columns in the
  end
                                     given row of the table
  return
end
                     15110 Principles of Computing.
```

Carnegie Mellon University - CORTINA

Stacks

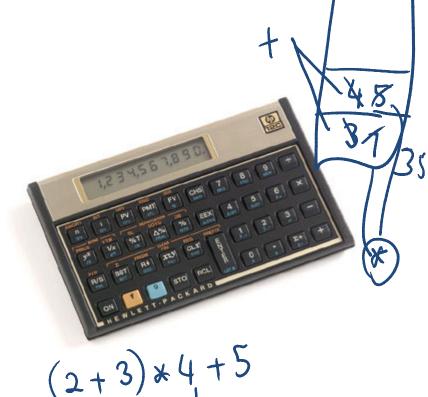

- A stack is a data structure that works on the principle of Last In First Out (LIFO).
 - LIFO: The last item put on the stack is the first item that can be taken off.
- Common stack operations:
 - Push put a new element on to the top of the stack
 - Pop remove the top element from the top of the stack
- Applications: calculators, compilers, programming

 Some modern calculators use Reverse Polish Notation (RPN)

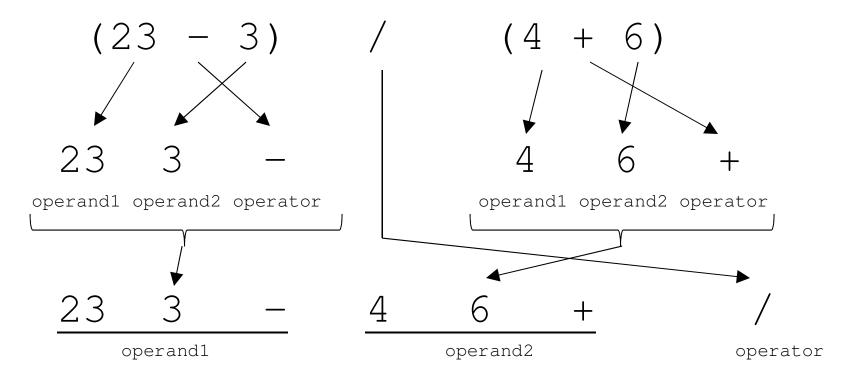

- Developed in 1920 by
 Jan Lukasiewicz
- Computation of mathematical formulas can be done without using any parentheses

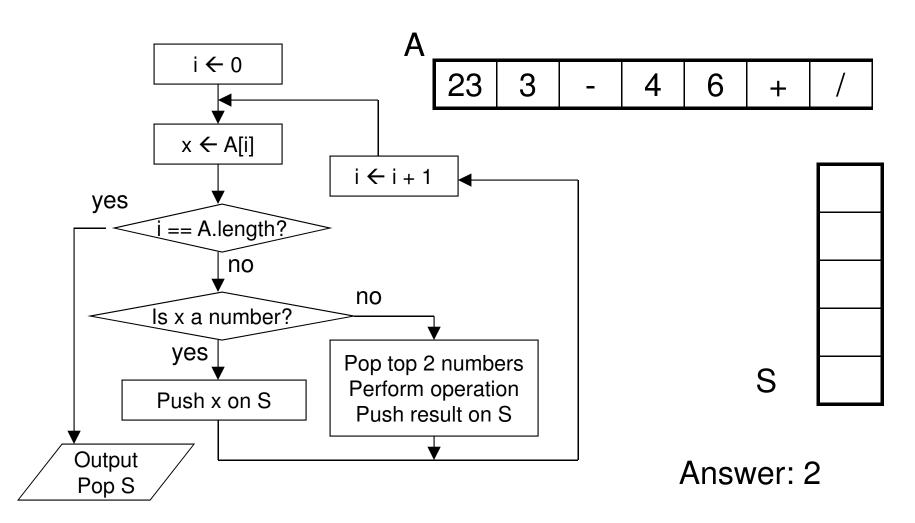

15110 Principles of Computing, Carnegie Mellon University - CORTINA

RPN Example

Convert the following standard mathematical expression into RPN:

Evaluating RPN with a Stack

Stacks in Ruby

You can treat arrays (lists) as stacks in Ruby.

	stack	X
stack = []	[]	
stack.push(1)	[1]	
stack.push(2)	[1,2]	
stack.push(3)	[1,2,3]	
x = stack.pop()	[1,2]	3
x = stack.pop()	[1]	2
x = stack.pop()	[]	1
x = stack.pop()	nil	nil
