VIDEO GAME MOOD TAXONOMY

STEPHANIE ROSSI | MLIS

TAXONOMY CREATION & APPLICATION
FROM THE PERSPECTIVE OF USERS

INTRODUCTION

The mood taxonomy, developed by the Game Metadata Research Group, in collaboration with the SIMM, is part of the Video Game Metadata Schema. This project expands upon current research, furthering our understanding of how people perceive and describe the mood of video games and interactive media.

METHOD

Metadata: video game title list with 1500+ entries.
User Study and Exercise: 26 gamers completed questionnaires, were interviewed and asked to apply mood terms to popular video game titles.

RESULTS

Study Data: interview transcripts and exercise data.
Data Analysis: sample of 300 games with sourced genre and year (from allgame.com).
Term Suggestions: mood term suggestions collected from gamerDNA and interview data.
Mood Clustering: hierarchical clustering of current preferred terms.

TOP THREE MOODS BY GENRE

The diagram to the left explores the genre breakdown of mood terms applied to a sample of 300 games. The top three mood terms are represented by dark blue, orange, and light blue lines, respectively.

CURRENT MOOD TERMS

adventurous	humorous	quirky
aggressive	imaginative	romantic
cute	intense	sad
dark	light-hearted	sarcastic
horror	mysterious	sensual
	peaceful	solitary

MOOD TERM SUGGESTIONS

Preferred Terms

- casual*
- competitive*
- epic*
- friendly/social
- immersive

Equivalent Terms

- charming
- exciting
- happy
- weird
- wonder

*Mentioned in both gamerDNA and interview data

MOOD STUDY DATA ANALYSIS

As part of the exercise, participants were asked to apply mood terms to 35 video game titles. Below are the four most recognized video game titles with their applied mood terms.

ANGRY BIRDS

ASSASSIN'S CREED III

GRAND THEFT AUTO IV

SUPER MARIO BROS.

While a large number of participants applied the same top mood term to *Angry Birds* (light-hearted), *Assassin's Creed III* (adventurous) and *Grand Theft Auto IV* (aggressive) opinion was more split over *Super Mario Bros.*

MOOD CLUSTER DATA

Mood Term Dendrogram

This graph represents mood terms that appear frequently together in the collected interview data. The results indicate that the mood terms intense and aggressive, light-hearted and cute, and horror and dark are applied often together when describing video game mood. Clustering mood terms will allow us to use groups of particular mood terms instead of individual terms to obtain more consistent results.

Categories and Objects

First-order logic for ontological representations

Category: Basketball

- Predicate: *Basketball(b)*
- Object for category: *Basketballs*
 - *Member(b, Basketballs)*
 - Notation shortcut: $b \in \text{Basketballs}$
 - *Subset(Basketballs, Balls)*
 - Notation shortcut: $\text{Basketball} \subset \text{Balls}$
- Specific object
 - $\text{Basketball}_{12} \in \text{Basketballs}$

Reification: converting category predicate into an object

Categories and Objects

Decompositions and Partitions

Disjoint({Animals, Vegetables})

ExhaustiveDecomposition({Canadians, Americans, Mexicans}, NorthAmericans)

Partition({Canada, United States, Mexico}, NorthAmericanCountries)

Categories and Objects

Parts

PartOf(Bucharest, Romania)

PartOf(Romania, EasternEurope)

PartOf(EasterEurope, Europe)

Transitive

PartOf(x, y) $\wedge$ PartOf(y, z) $\Rightarrow$ PartOf(x, z)

Reflexive

PartOf(x, x)

Categories and Objects

Measurements

Number are objects

Units are typically functions to convert number constants to measurements

$$\textit{Length}(L_1) = \textit{Inches}(1.5) = \textit{Centimeters}(3.81)$$

Categories and Objects

Bunches of Things and Stuff

BunchOf ($\{Apple_1, Apple_2, Apple_3\}$)

Things

- Countable
- “The” apple, “an” apple

Stuff

- More of a mass
- “Some” water
- $b \in Butter \wedge PartOf(p, b) \Rightarrow p \in Butter$

Events

How to handle fluents?

President(USA)

President(USA, t)

T(Equals(President(USA), GeorgeWashington), AD1790)

Events

How to handle time?

Semantic Networks

A graphical representation for some types of knowledge

- Once viewed as an “alternative” to logic (it’s not really)
- The IS-A relation often forms the backbone of a semantic network

Vertebrate

Mammal

Elephant

Clyde

Semantic Networks

Reasoning with default information

Dog

- Barks
- Has Fur
- Has four legs

Buster

Semantic Networks

Knowledge panels in Google search results

The panels are generated from what's called the **Google Knowledge Graph**.

Data comes from Wikipedia, CIA World Factbook, and other online sources.

As of Oct. 2016, held 70 billion facts.

Thomas Jefferson

3rd U.S. President

Thomas Jefferson was an American Founding Father who was the principal author of the Declaration of Independence and later served as the third President of the United States from 1801 to 1809. Previously, he had been elected the second Vice President of the United States, serving under John Adams from 1797 to 1801. [Wikipedia](#)

“Person” schema at schema.org

Person

Canonical URL: <http://schema.org/Person>

[Thing](#) > [Person](#)

A person (alive, dead, undead, or fictional).

Usage: Over 1,000,000 domains

Property	Expected Type	Description
Properties from Person		
additionalName	Text	An additional name for a Person, can be used for a middle name.
address	PostalAddress or Text	Physical address of the item.
affiliation	Organization	An organization that this person is affiliated with. For example, a school/university, a club, or a team.
alumniOf	EducationalOrganization or Organization	An organization that the person is an alumni of. Inverse property: alumni .
award	Text	An award won by or for this item. Supersedes awards .
birthDate	Date	Date of birth.
birthPlace	Place	The place where the person was born.
brand	Brand or Organization	The brand(s) associated with a product or service, or the brand(s) maintained by an organization or business person.
children	Person	A child of the person.
colleague	Person or URL	A colleague of the person. Supersedes colleagues .
contactPoint	ContactPoint	A contact point for a person or organization. Supersedes contactPoints .
deathDate	Date	Date of death.
deathPlace	Place	The place where the person died.
duns	Text	The Dun & Bradstreet DUNS number for identifying an organization or business person.
email	Text	Email address.
familyName	Text	Family name. In the U.S., the last name of an Person. This can be used along with givenName instead of the name property.
faxNumber	Text	The fax number.
follows	Person	The most generic uni-directional social relation.

The Semantic Web

- Term coined by Tim Berners-Lee
- Common framework for exchange of data across application, enterprise, and community boundaries
- HTML defines how text should look when presented to humans
- Semantic web markup defines how information should be organized to be interpretable by machines
- “Ontology engineer” is a job description now

NELL: Never-Ending Language Learner

Inputs:

- initial ontology
- few examples of each ontology predicate
- the web
- occasional interaction with human trainers

The task:

- run 24x7, forever
- each day:
 1. extract more facts from the web to populate the initial ontology
 2. learn to read (perform #1) better than yesterday

NELL Overview

Running 24x7, since January, 12, 2010

Inputs:

- ontology defining >600 categories and relations
- 10-20 seed examples of each
- 500 million web pages
- 100,000 web search queries per day
- ~ 5 minutes/day of human guidance

Result:

- KB with > 15 million candidate beliefs, growing daily
- learning to reason, as well as read
- automatically extending its ontology

NELL knowledge fragment

Default Approach

Its underconstrained!!

Extract cities:

Paris
Pittsburgh
Seattle
Cupertino

San Francisco
Austin
denial

anxiety
selfishness
Berlin

mayor of arg1
live in arg1

arg1 is home of
traits such as arg1

Key Idea 1: Coupled semi-supervised training of many functions

hard

(underconstrained)
semi-supervised
learning problem

much easier (more constrained)
semi-supervised learning problem

Type 1 Coupling: Co-Training, Multi-View Learning

[Blum & Mitchell; 98]
[Dasgupta et al; 01]
[Ganchev et al., 08]
[Sridharan & Kakade, 08]
[Wang & Zhou, ICML10]

Type 2 Coupling: Multi-task, Structured Outputs

[Daume, 2008]

[Bakhr et al., eds. 2007]

[Roth et al., 2008]

[Taskar et al., 2009]

[Carlson et al., 2009]

— athlete(NP) → person(NP)

— athlete(NP) → NOT sport(NP)

NOT athlete(NP) ← sport(NP)

Multi-view, Multi-Task Coupling

Learning Relations between NP's

Type 3 Coupling: Argument Types

$\text{playsSport}(\text{NP1}, \text{NP2}) \rightarrow \text{athlete}(\text{NP1}), \text{sport}(\text{NP2})$

over 2500 coupled functions in NELL

Basic NELL Architecture

NELL: Learned reading strategies

Plays_Sport(arg1,arg2):

arg1_was_playing_arg2 arg2_megastar_arg1 arg2_icons_arg1

If coupled learning is the key,
how can we get new coupling constraints?

Key Idea 2:

Discover New Coupling Constraints

- first order, probabilistic horn clause constraints:

0.93 athletePlaysSport(?x,?y) $\leftarrow$ athletePlaysForTeam(?x,?z)
teamPlaysSport(?z,?y)

- connects previously uncoupled relation predicates
- infers new beliefs for KB

Example Learned Horn Clauses

0.95 athletePlaysSport(?x,basketball) $\leftarrow$ athleteInLeague(?x,NBA)

0.93 athletePlaysSport(?x,?y) $\leftarrow$ athletePlaysForTeam(?x,?z)
teamPlaysSport(?z,?y)

0.91 teamPlaysInLeague(?x,NHL) $\leftarrow$ teamWonTrophy(?x,Stanley_Cup)

0.90 athleteInLeague(?x,?y) $\leftarrow$ athletePlaysForTeam(?x,?z),
teamPlaysInLeague(?z,?y)

0.88 cityInState(?x,?y) $\leftarrow$ cityCapitalOfState(?x,?y), cityInCountry(?y,USA)

0.62* newspaperInCity(?x,New_York) $\leftarrow$ companyEconomicSector(?x,media)
generalizations(?x,blog)

Some rejected learned rules

cityCapitalOfState{?x ?y} $\leftarrow$ cityLocatedInState{?x ?y},
teamPlaysInLeague{?y nba}

teamplayssport{?x, basketball} $\leftarrow$ generalizations{?x, university}

Learned Probabilistic Horn Clause Rules

0.93 $\text{playsSport}(?x,?y) \leftarrow \text{playsForTeam}(?x,?z), \text{teamPlaysSport}(?z,?y)$

Key Idea 3:

Automatically extend ontology

Ontology Extension (1)

[Mohamed et al., *EMNLP* 2011]

Goal:

- Add new relations to ontology

Approach:

- For each pair of categories C1, C2,
 - co-cluster pairs of known instances, and text contexts that connect them

Example Discovered Relations

[Mohamed et al. *EMNLP* 2011]

Category Pair	Text contexts	Extracted Instances	Suggested Name
MusicInstrument Musician	ARG1 master ARG2 ARG1 virtuoso ARG2 ARG1 legend ARG2 ARG2 plays ARG1	sitar , George Harrison tenor sax, Stan Getz trombone, Tommy Dorsey vibes, Lionel Hampton	Master
Disease Disease	ARG1 is due to ARG2 ARG1 is caused by ARG2	pinched nerve, herniated disk tennis elbow, tendonitis blepharospasm, dystonia	IsDueTo
CellType Chemical	ARG1 that release ARG2 ARG2 releasing ARG1	epithelial cells, surfactant neurons, serotonin mast cells, histomine	ThatRelease
Mammals Plant	ARG1 eat ARG2 ARG2 eating ARG1	koala bears, eucalyptus sheep, grasses goats, saplings	Eat
River City	ARG1 in heart of ARG2 ARG1 which flows through ARG2	Seine, Paris Nile, Cairo Tiber river, Rome	InHeartOf

Key Idea 4: Cumulative, Staged Learning

Learning X improves ability to learn Y

1. Classify noun phrases (NP's) by category
2. Classify NP pairs by relation
3. Discover rules to predict new relation instances
4. Learn which NP's (co)refer to which concepts
5. Discover new relations to extend ontology
6. Learn to infer relation instances via targeted random walks
7. Learn to assign temporal scope to beliefs
8. Learn to microread single sentences
9. Vision: co-train text and visual object recognition
10. Goal-driven reading: predict, then read to corroborate/correct
11. Make NELL a conversational agent on Twitter
