## Warm-up:

The regions below visually enclose the set of models that satisfy the respective sentence $\gamma$ or $\delta$. For which of the following diagrams does $\gamma$ entail $\delta$. Select all that apply.

## Announcements

Midterm 1 Exam

- Grading should be finished tomorrow night
- Then we'll let you know as soon as Canvas reflects your current grade

## Assignments:

- P2: Optimization
- Due Thu 2/21, 10 pm
- HW5
- Out later tonight

## Announcements

Index card feedback

- Thanks!
- Piazza with some responses tonight

## Alita Class Field Trip!

- Saturday, 2/23, afternoon
- Details will be posted on Piazza

## AI: Representation and Problem Solving

## Logical Agents

Instructors: Pat Virtue \& Stephanie Rosenthal

## Piazza Poll 1

The regions below visually enclose the set of models that satisfy the respective sentence $\gamma$ or $\delta$. For which of the following diagrams does $\gamma$ entail $\delta$. Select all that apply.

## What about intersection feasible regions?

The regions below visually enclose the set of points that satisfy the respective constraints $\gamma$ or $\delta$. For which of the following diagrams is a solution point for $\gamma$ guaranteed to be feasible in $\delta$. Select all that apply.

C)

## Piazza Poll 1

$$
\gamma \vDash \delta
$$

The regions below visually enclose the set of models that satisfy the respective sentence $\gamma$ or $\delta$. For which of the following diagrams does $\gamma$ entail $\delta$. Select all that apply.

B)

D)

E)

## Entailment

Does the knowledge base entail my query?

- Query 1: $\neg P[1,2]$
- Query 2: $\neg P[1,2]$

## Logical Agent Vocab

## Model

- Complete assignment of symbols to True/False

## Sentence

- Logical statement
- Composition of logic symbols and operators

## KB

- Collection of sentences representing facts and rules we know about the world

## Query

- Sentence we want to know if it is provably True, provably False, or unsure.

## Logical Agent Vocab

## Entailment

- Input: sentence1, sentence2
- Each model that satisfies sentence1 must also satisfy sentence2
- "If I know 1 holds, then I know 2 holds"
- (ASK), , TT-ENTAILS, FC-ENTAILS

## Satisfy

- Input: model, sentence
- Is this sentence true in this model?
- Does this model satisfy this sentence
- "Does this particular state of the world work?'
- PL-TRUE

## Logical Agent Vocab

## Satisfiable

- Input: sentence
- Can find at least one model that satisfies this sentence
- (We often want to know what that model is)
- "Is it possible to make this sentence true?"
- DPLL

Valid

- Input: sentence
- sentence is true in all possible models

## Propositional Logical Vocab

## Literal

- Atomic sentence: True, False, Symbol, $\underset{j}{ }$ Symbol

## Clause

- Disjunction of literals: $A \vee B \vee \neg C$

Definite clause

- Disjunction of literals, exactly one is positive
- $\neg A \vee \underline{B} \vee \neg C$

Horn clause

- Disjunction of literals, at most one is positive
- All definite clauses are Horn clauses

## Propositional Logic

Check if sentence is true in given model In other words, does the model satisfy the sentence?
function PL-TRUE?( $\alpha$, model) returns true or false if $\alpha$ is a symbol then return Lookup( $\alpha$, model) if $\operatorname{Op}(\alpha)=\neg$ then return not(PL-TRUE?(Arg1( $\alpha$ ), model)) if $\mathrm{Op}(\alpha)=\wedge$ then return and(PL-TRUE? $(\operatorname{Arg} 1(\alpha)$,model),

PL-TRUE?(Arg2( $\alpha$ ),model))
etc.
(Sometimes called "recursion over syntax")

## Simple Model Checking

function TT-ENTAILS?(KB, $\alpha$ ) returns true or false

## Simple Model Checking, contd.

Same recursion as backtracking O(2 $2^{n}$ time, linear space
We can do much better!

## Piazza Poll 2

Which would you choose?

- DFS
- BFS

## Simple Model Checking

function TT-ENTAILS? (KB, $\alpha$ ) returns true or false return TT-CHECK-ALL(KB, $\alpha$, symbols(KB) U symbols $(\alpha),\{ \})$
function TT-CHECK-ALL(KB, $\alpha$, symbols, model) returns true or false if empty?(symbols) then
if PL-TRUE?(KB, model) then return PL-TRUE?( $\alpha$, model)
else return true
else
$P \leftarrow$ first(symbols)
rest $\leftarrow$ rest(symbols)
return and (TT-CHECK-ALL(KB, $\alpha$, rest, model $\cup\{P=$ true $\}$ )
TT-CHECK-ALL(KB, $\alpha$, rest, model $\cup\{P=$ false $\}))$

## Inference: Proofs

A proof is a demonstration of entailment between $\alpha$ and $\beta$
Method 1: model-checking

- For every possible world, if $\alpha$ is true make sure that is $\beta$ true too
- OK for propositional logic (finitely many worlds); not easy for first-order logic

Method 2: theorem-proving

- Search for a sequence of proof steps (applications of inference rules) leading from $\alpha$ to $\beta$
- E.g., from $P \wedge(P \Rightarrow Q)$, infer $Q$ by Modus Ponens

## Properties

- Sound algorithm: everything it claims to prove is in fact entailed
- Complete algorithm: every sentence that is entailed can be proved

## Simple Theorem Proving: Forward Chaining

Forward chaining applies Modus Ponens to generate new facts:

- Given $X_{1} \wedge X_{2} \wedge \ldots X_{n} \Rightarrow Y$ and $X_{1}, X_{2}, \ldots, X_{n}$
- Infer Y

Forward chaining keeps applying this rule, adding new facts, until nothing more can be added

Requires KB to contain only definite clauses:

- (Conjunction of symbols) $\Rightarrow$ symbol; or
- A single symbol (note that $X$ is equivalent to True $\Rightarrow X$ )

## Forward Chaining Algorithm

function PL-FC-ENTAILS?(KB, q) returns true or false
count $\leftarrow$ a table, where count[c] is the number of symbols in c's premise inferred $\leftarrow$ a table, where inferred[s] is initially false for all s agenda $\leftarrow$ a queue of symbols, initially symbols known to be true in KB

| CLAUSES | Count | Inferred | AGENDA |
| :--- | :---: | :--- | :--- |
| $\mathrm{P} \Rightarrow \mathrm{Q}$ | 1 | A false |  |
| $\mathrm{L} \wedge \mathrm{M} \Rightarrow \mathrm{P}$ | 2 | B false |  |
| $\mathrm{B} \wedge \mathrm{L} \Rightarrow \mathrm{M}$ | 2 | L false |  |
| $\mathrm{A} \wedge \mathrm{P} \Rightarrow \mathrm{L}$ | 2 | M false |  |
| $\mathrm{A} \wedge \mathrm{B} \Rightarrow \mathrm{L}$ | 2 | P false |  |
| A | 0 | Q false |  |
| B | 0 |  |  |

## Forward Chaining Algorithm

function PL-FC-ENTAILS?(KB, q) returns true or false
count $\leftarrow$ a table, where count[c] is the number of symbols in c's premise inferred $\leftarrow$ a table, where inferred[s] is initially false for all s agenda $\leftarrow$ a queue of symbols, initially symbols known to be true in KB while agenda is not empty do

```
p}\leftarrow\mathrm{ Pop(agenda)
if p = q then return true
if inferred[p] = false then
    inferred[p]<true
    for each clause c in KB where p is in c.premise do
        decrement count[c]
        if count[c] = 0 then add c.conclusion to agenda
```

return false

## Properties of forward chaining

Theorem: FC is sound and complete for definite-clause KBS
Soundness: follows from soundness of Modus Ponens (easy to check)
Completeness proof:

1. FC reaches a fixed point where no new atomic sentences are derived
2. Consider the final inferred table as a model $\boldsymbol{m}$, assigning true/false to symbols
3. Every clause in the original KB is true in $m$

Proof: Suppose a clause $a_{1} \wedge \ldots \wedge a_{k} \Rightarrow b$ is false in $\boldsymbol{m}$
A daksetrue
Then $a_{1} \wedge \ldots \wedge a_{k}$ is true in $\boldsymbol{m}$ and $b$ is false in $\boldsymbol{m}$
Therefore the algorithm has not reached a fixed point!
4. Hence $\boldsymbol{m}$ is a model of $K B$
5. If $K B \mid=q, q$ is true in every model of $K B$, including $\boldsymbol{m}$

B fadsetrue
L \{ $8 \times k$ ketrue M $\times 8 \times x$ setrue
P kakketrue
Q *\& \& y yetrue

## Satisfiability and Entailment

A sentence is satisfiable if it is true in at least one world (CSPs!)
Suppose we have a hyper-efficient SAT solver; how can we use it to test entailment?

- Suppose $\alpha \mid=\beta$
- Then $\alpha \Rightarrow \beta$ is true in all worlds
- Hence $\neg(\alpha \Rightarrow \beta)$ is false in all worlds
- Hence $\alpha \wedge \neg \beta$ is false in all worlds, ie., unsatisfiable

So, add the negated conclusion to what you know, test for (un)satisfiability; also known as reductio ad absurdum

$$
\operatorname{SAT}(K B \wedge \neg q)
$$

Efficient SAT solvers operate on conjunctive normal form

## Conjunctive Normal Form (CNF)

Every sentence can be expressed Replace biconditional by two implications
Each clause is a disjunction of literal

$$
\text { Replace } \alpha \Rightarrow \beta \text { by } \neg \alpha \vee \beta
$$

Each literal is a symbol or a neo asypo
Distribute vover $\wedge$
Conversion to CNF by a seraence andard transion

- At_1,1_0 $\Rightarrow$ (Wall_0,1 $\Leftrightarrow$ Blocy a_W_0)
- At_1,1_0 $\Rightarrow\left(\left(\right.\right.$ Wall_0,1 $\Rightarrow$ Blocked_W_0) $\wedge\left(\right.$ Bloc $^{\prime}$ - ${ }_{-}$W_0 $\Rightarrow$ Wall_0,1) $)$
- $\neg$ At_1,1_0 v (( $\rightarrow$ Wall_0,1 v Blocked_W_0) ^( $\neg$ Blocked_W_0 v Wall_0,1))
- $\left(\neg\right.$ At_1,1_0 v $\neg$ Wall_0,1 v Blocked_W_0) $\wedge\left(\neg A t \_1,1 \_0 \quad \vee \quad\right.$ Blocked_W_0 v Wall_0,1)

## Efficient SAT solvers

## DPLL (Davis-Putnam-Logemann-Loveland) is the core of modern solvers

## Essentially a backtracking search over models with some extras:

- Early termination: stop if
- all clauses are satisfied; e.g., $(A \vee B) \wedge(A \vee \neg C)$ is satisfied by $\{A=t r u e\}$
- any clause is falsified; e.g., $(A \vee B) \wedge(A \vee \neg C)$ is satisfied by $\{A=f a l s e, B=f a l s e\}$
- Pure literals: if all occurrences of a symbol in as-yet-unsatisfied clauses have the same sign, then give the symbol that value
- E.g., $A$ is pure and positive in $(A \vee B) \wedge(A \vee \neg C) \wedge(C \vee \neg B)$ so set it to true
- Unit clauses: if a clause is left with a single literal, set symbol to satisfy clause
- E.g., if $A=$ false, $(A \vee B) \wedge(A \vee \neg C)$ becomes (false $\vee B) \wedge($ false $\vee \neg C)$, i.e. $(B) \wedge(\neg C)$
- Satisfying the unit clauses often leads to further propagation, new unit clauses, etc.

## DPLL algorithm

function DPLL(clauses, symbols, model) returns true or false
if every clause in clauses is true in model then return true if some clause in clauses is false in model then return false

P, value $\leftarrow$ FIND-PURE-SYMBOL(symbols, clauses, model)
if $P$ is non-null then return $\operatorname{DPLL}(c l a u s e s, ~ s y m b o l s-P, ~ m o d e l U\{P=v a l u e\})$
P, value $\leftarrow$ FIND-UNIT-CLAUSE(clauses, model)
if $P$ is non-null then return $\operatorname{DPLL}($ clauses, symbols $-P$, modelU\{ $P=$ value $\})$
$\mathrm{P} \leftarrow$ First(symbols)
rest $\leftarrow$ Rest(symbols)
return or(DPLL(clauses, rest, modelU\{P=true\}),
DPLL(clauses, rest, modelU\{P=false\}))

## Planning as Satisfiability

Given a hyper-efficient SAT solver, can we use it to make plans?
Yes, for fully observable, deterministic case: planning problem is solvable iff there is some satisfying assignment for actions etc.

SCORE: 0

SCORE: 0

## Planning as Satisfiability

Given a hyper-efficient SAT solver, can we use it to make plans? Yes, for fully observable, deterministic case: planning problem is solvable iff there is some satisfying assignment for actions etc.

For $\mathrm{T}=1$ to infinity, set up the KB as follows and run SAT solver:

- Initial state, domain constraints
- Transition model sentences up to time T
- Goal is true at time T
- Precondition axioms: At_1,1_0 $\wedge \mathrm{N} \_0 \Rightarrow \neg$ Wall_1,2 etc.
- Action exclusion axioms: $\neg\left(N \_0 \wedge W \_0\right) \wedge \neg\left(N \_0 \wedge S \_0\right) \wedge$.. etc.

## Initial State

The agent may know its initial location:

- At_1,1_0

Or, it may not:

- At_1,1_0 v At_1,2_0 v At_1,3_0 v ... v At_3,3_0

We also need a domain constraint - cannot be in two places at once!

- $\neg\left(\right.$ At_1,1_0 $\wedge$ At_1,2_0) $\wedge \neg\left(A t \_1,1 \_0 \wedge\right.$ At_1,3_0) $\wedge ~ . . . ~$
- $\neg\left(A t \_1,1 \_1 \wedge\right.$ At_1,2_1) $\wedge \neg\left(A t \_1,1 \_1 \wedge\right.$ At_1,3_1) $\wedge . .$.
- ...

## Transition Model

How does each state variable or fluent at each time gets its value?
State variables for PL Pacman are At_x,y $\in t$. e.g., At_3,3_17
A state variable gets its value according to a successor-state axiom

- $\mathrm{X}_{\mathrm{t}} \Leftrightarrow\left[\mathrm{X}_{\mathrm{t}-1} \wedge \Theta_{\text {s }}\right.$ some action ${ }_{t-1}$ made it false) $]$ v
$\left[\underline{\mathrm{X}_{\mathrm{t}-1}} \wedge\right.$ (some action ${ }_{\mathrm{t}-1}$ made it true) $]$
For Pacman location:

$$
\begin{gathered}
\text { - At_3,3_17 } \Leftrightarrow\left[\text { At_3,3_16 } \wedge \neg\left(\left(\neg \text { Wall_3,4 } \wedge N \_16\right) \vee\left(\neg \text { Wall_4,3 } \wedge E \_16\right) v \ldots\right)\right] \\
v\left[\neg \text { At_3,3_16 } \wedge \left(\left(\text { At_3,2_16 } \wedge \neg \text { Wall_3,3 } \wedge N \_16\right) \vee\right.\right. \\
\left.\left.\left(\text { At_2,3_16 } \wedge \neg \text { Wall_3,3 } \wedge N \_16\right) v \ldots\right)\right]
\end{gathered}
$$
