

## Software Estimation

What you need to know  
Mel Rosso-Llopart  
rossollo@cmu.edu

2 September, 2005 ©Copyright Rosso-Llopart 1

## Session Objectives

- Where is the software industry with estimation of project
  - Why are we bad at estimating?
- What do we mean by a ROM (Rough order of magnitude)
- What are some different ways of quickly estimating an effort
  - Uses of cost estimates
- What are the Critical factors we must consider when estimating software projects

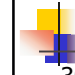

2 September, 2005 ©Copyright Rosso-Llopart 2

## My Background

- B.S., Physics and Biology, University of California, Riverside
- BS, Computer Science, University of California, Riverside
- 4/1983-11/1998, Department of Defense, Edwards AFB California
- Graduate MSE program 1992
- Software Engineering manager, Adtranz Train Division
- 2000-present, Assoc. Professor, Carnegie Mellon

2 September, 2005 ©Copyright Rosso-Llopart 3

## Why Estimate Software?

- 30% of project never complete
- 100-200% cost overruns not uncommon
- Average project exceeds cost by 90%; Schedule by 120%
- 15% of large project never deliver anything
- Only 16.2% of projects are successful

\* 1998, 1999, 2000 Standish report, Chaos

2 September, 2005 ©Copyright Rosso-Llopart 4

## Problem for Estimates

- Parkinson's Law
  - Cost will rise to meet budget
  - Work expands to fill the resources available

2 September, 2005 ©Copyright Rosso-Llopart 5

## What are the consequences?

- Economic
  - Loss of contracts
  - Company failure
- Technical
  - Dependency on software growing
- Managerial
  - Change of personnel

2 September, 2005 ©Copyright Rosso-Llopart 6

## Why are we bad at estimating?

- Complexity of the systems
  - Infrequency - How often do we do the "same thing"
    - Vs manufacturing or construction
  - Underestimation bias
    - Computers are "easy"; software is "easy"
  - We deal with Goals not estimates
    - Must be done by June
  - Complexity is what makes estimating hard

2 September, 2005

©Copyright Rosso-Uopart

7

## Why are we bad at estimating? (2)

- Complexity of the systems
  - ~1000 FP in a pace maker (50K)
  - ~18,800 FP in shuttle test scaffolding (1,000,000 LOC)
  - ~75,400 FP in Nynex Switch (4,000,000LOC)
- "Human brain capacity is more or less fixed, but software complexity grows at least as fast as the square of the size of the project"

Tony Bowden

## Early Estimation In the bid for example

- No "real" money in the bid
- Must estimate on your dollar
- What is important for this estimate
  - Can I compare to history
- Done as quickly and cheaply as possible
- How important is it?

2 September, 2005

©Copyright Rosso-Uopart

9

## Early Size Estimation Critical, Yet Dangerous

- You need to know size in order to bid, but the time you know the least about the real size is at the beginning
- Construction analogy: given some set of metrics [square footage, number of corners, volume of concrete, etc] a contractor can estimate cost; does this relate to software?

2 September, 2005

©Copyright Rosso-Uopart

10

## Estimation techniques

- No simple way to make accurate estimates of the effort for a software system
  - Initial estimates based on inadequate information
    - user requirements definition
  - Software may run on unfamiliar environments
    - Different computers or new technology
  - The people in the project may be unknown
- Project cost estimates may be self-fulfilling
  - The estimate defines the budget and the product is adjusted to meet the budget

2 September, 2005

11

## Computing Project costs

- Development effort is known
    - Person-Months
  - Cost per development unit is known
- Cost of Project =  
Number of Person-Months X  
Weighted average cost\* per month

\* Weighted average cost = burdened cost  
and can be 2 to 3 times salary.

2 September, 2005

©Copyright Rosso-Uopart

12

## Problem

- The accuracy of the previous equation depends on what?
  - Project Cost = Time X Unit Cost
- Accuracy of the development effort estimate
- Accuracy of the cost per unit
- Which one do we normally know?

2 September, 2005 ©Copyright Rosso-Uopart 13

## Determining "development effort"

- Development effort measures
  - Person-Month
  - LOC per Hour
  - Function point per hour
  - Requirement per hour
- Most common is person-months (or hours)
- Let's look at ways to get development effort

2 September, 2005 ©Copyright Rosso-Uopart 14

## First look for "similarities"

- Have we done something similar
- Do we have data on that project
- How long ago was it
  - Geometric loss of understanding
- Do we still have the expertise
  - Expertise does not last
- Do we have the artifacts from that project
  - Can we read them

2 September, 2005 ©Copyright Rosso-Uopart 15

## Next look for "differences"

- Do we understand the differences
- Do we have expertise in this new area
  - Training cost time and money
  - Can we get the expertise quickly
- Do we have a proxy for this difference
  - Have we done something similar on other projects

2 September, 2005 ©Copyright Rosso-Uopart 16

## Conceptual design

- Can we create a rough solution
  - End to end
  - How big or small should the parts be
- Can we estimate the parts
- Never confuse Conceptual with actual design
  - This is for estimating, you will redo if you win the bid

2 September, 2005 ©Copyright Rosso-Uopart 17

## Conceptual Design

- Never, *ever*, confuse this with the "real" design
- Objective is to make this as fine-grained as possible without making commitments

2 September, 2005 ©Copyright Rosso-Uopart 18

## Estimating exercise 1

- How many tennis balls will it take to fill this room?
  - How would you go about making the estimate?
  - What do you need to know?
  - What assumptions would you make?

2 September, 2005 ©Copyright Rosso-Uopart 19

## Estimating exercise 2

- If the project is well understood
  - 2 months to deliver (40 days)
  - 25 LOC per day per engineer
  - Estimated 5000 LOC
  - How many people needed?

What are the major assumptions above?

2 September, 2005 ©Copyright Rosso-Uopart 20

## Other methods: Large Scale Analogy

- Similar size of projects
- Similar type of projects
- Similar size of components
- Similar type of components
- Requirements type and size...
- Create a handbook of estimating history you can use
- No data makes it harder

2 September, 2005 ©Copyright Rosso-Uopart 21

## Improving Your Chances: Wideband Delphi

Six step process

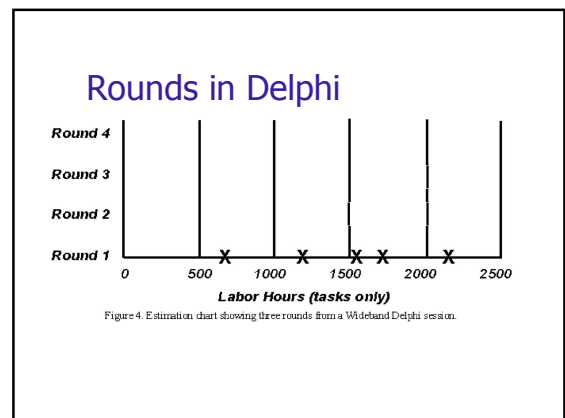

- Planning – define the scope of the problem
  - Break large problems into smaller
- The Kickoff – To deliver problem to team
- Individual preparation – Everyone does individual estimates on problem parts
  - All assumptions are written down
- Estimation Meeting – Everyone on team gets together
- Assembling Tasks – Put together the whole project of estimates
- Review Results – Bring team back to review final results

2 September, 2005 ©Copyright Rosso-Uopart 22

## The Delphi process in Wideband

- Estimation Meeting
  - A moderator collects the estimates for the task being estimated
    - Present the average or a line with all estimates (anonymous)
  - The estimate is discussed and assumptions presented
  - Moderator calls for a new estimate from everyone
  - Values are again presented to the team as average or line
  - Continue process until:
    - Four rounds are completed
    - The estimates "converged" to an acceptably narrow range
    - The allotted meeting time is complete
    - All participants are unwilling to change their estimates
  - 15-20 minutes per item discussed

2 September, 2005 ©Copyright Rosso-Uopart 23

## Rules to insure best results for Wideband Delphi

- Gather a heterogeneous team
- Write down assumptions
- Make anonymous estimates
- Never estimate tasks larger than you are comfortable with
- This is "estimation" not "prediction"

2 September, 2005

©Copyright Rosso-Uopart

25

## Clark's Method

- Modularize the product
- Make best estimate per module
- Determine upper and lower size limits
- Size =  $\sum$  module sizes which =

$$\frac{\text{Largest} + 4 * \text{Middle} + \text{Smallest}}{6}$$

2 September, 2005

©Copyright Rosso-Uopart

26

## Uses of Cost estimation

- Project planning and Control
  - Best and timely use of resources
- Budgeting
  - Planning and allocation of resources
  - Bidding
- Software design improvement
  - Find a first solution (Is there a better one?)
- Risk Analysis

2 September, 2005

©Copyright Rosso-Uopart

27

## Estimating critical factors

- X 5 for Safety critical software (ASWEC'97)
- X 5 for embedded systems (S/W Eng, 6th Ed.; Ian Sommerville)
- X 1.5 for Reusable code
- X 2.5 for distributed (Herbsleb, IEEE June 2003)

2 September, 2005

©Copyright Rosso-Uopart

28

## Outsourcing issues (higher cost)\*

- Additional communication
  - Interval between questions and answers
- Distributed social networks not as affective as local networks
- Modification requests take longer to coordinate

\* J.D.Herbsleb and A.Mockus "An Empirical Study...Software development, IEEE June 2003

2 September, 2005

©Copyright Rosso-Uopart

29

## Past experience

- Experience is the "worst teacher"
- ...it gives the test first and the lesson after
- Estimating gets better the more you do it
- Need history to get better at estimating

2 September, 2005

©Copyright Rosso-Uopart

30

## Experience-based estimates

- Estimating is primarily experience-based
- However, new methods and technologies may make estimating based on experience inaccurate
  - Object oriented rather than function-oriented development
  - Client-server systems rather than mainframe systems
  - Off the shelf components
  - Component-based software engineering
  - CASE tools and program generators

2 September, 2005 ©Copyright Rosso-Uopart 31

## Estimation accuracy

- The size of a software system can only be known accurately when it is finished
- Several factors influence the final size
  - Use of COTS and components
  - Programming language
  - Distribution of system
- As the development process progresses then the size estimate becomes more accurate

2 September, 2005 ©Copyright Rosso-Uopart 32

## Estimate uncertainty

2 September, 2005 ©Copyright Rosso-Uopart 33

## Pricing to win

- The project costs whatever the customer has to spend on it
- Advantages: You get the contract
- Disadvantages: The probability that the customer gets the system he or she wants is small. Costs do not accurately reflect the work required

2 September, 2005 ©Copyright Rosso-Uopart 34

## Summary

- You know now why we are bad at estimating
- You should understand what it means to create a ROM
- Some quick methods of estimating
  - Clark Method, Wideband Delphi, FP, etc.
- You know some of the Critical factors involved with estimating software projects

2 September, 2005 ©Copyright Rosso-Uopart 35

## Questions? Comments?

2 September, 2005 ©Copyright Rosso-Uopart 36
