

# Project Presentation

“Generic Python API for Robot Control”

---

Group 6  
Thomas Nourse  
Greg Hoch  
December 12, 2005

## Agenda

---

### **Project Overview**

- Problem
- Goals
- Product
- Demo

### **Results and Lessons**

- Results
  - Changes
  - Evaluation
  - Lessons Learned
-

## Project Overview

### The Problem

---

- Lack of code portability between robotic platforms.
    - Platforms have different interfaces to use the same hardware.
    - Platforms have different hardware with similar capabilities.
      - Range Finders (Laser vs. Sonar)
      - Drive Systems (Differential vs. Holonomic)
      - Communication (Serial vs. WiFi)
- 

## Project Overview

### Goals

---

- "Create a high level Python API which will run the same robot behaviors on multiple robots."
  - Portability
  - Extensibility
  - Simplicity
-

## Project Overview

### Goals - Robotic Landscape

---

## Project Overview

### Product

---

- ❑ Designed and implemented both the API and an example implementation on the Nomad Scout.
    - API : Hides the robotic platform from user if he/she desires.
    - Implementation: Bridges the gap between the API and the individual platform implementation
  - ❑ Documented with Doxygen the API and process necessary for extension.
-

## Project Overview

### Product – API

---

- ❑ Divided into sensors, actuators and configuration.
  - ❑ Single interface (RobotAPI) provides access to all robotic functionality.
    - Initializes from an easily interchangeable init file.
  - ❑ Programmatic way to discover robot type and general sensor / actuator capabilities.
- 

## Project Overview

### Product – Implementation

---

- ❑ Nomad scout as our test platform.
    - Useful for testing API conceptually.
    - Integral in documentation by example.
  - ❑ Implemented serial interface for basic communication with the robot.
  - ❑ Connected this interface with the API.
  - ❑ Functional test using a virtual null modem cable testing output against traces from the original C interface.
-

## Project Overview

### Product – Built in Extensibility

---

- ❑ Designed specifically to add new robots and robot functionality.
    - Robots split among directories / packages, easily interchangeable.
    - Extensible methods for determining the current type of robot being used.
  - ❑ Designed with flexibility to ease addition of new layers such as:
    - GUI Debugging Interface
    - Teleoperation Interface
- 

## Project Overview

### Demo – Basic Movement

---

**Command: "python nomad\_functional.py"**

---

## Project Overview

### Demo – Basic Movement

---

```
C:\WINDOWS\system32\cmd.exe
C:\Documents and Settings\thomas\Desktop\api2>python nomad_functional.py
Serial(id=0x8a97b0, open=True)(port='COM1', baudrate=38400, bytesize=8, parity='
N', stopbits=1, timeout=None, xonxoff=0, rtscts=0, dsrdtr=0)
Configuring all sonars to fire normally
Setting acceleration to a modest value
Are the sonars active (you should hear a clicking sound emanating from the robot
)? [y,n]:y
Front sonar reading:
59
Was the reading reasonable for the objects in front of the robot (in inches)? [y
,n]:y
Testing forward movement!
Please ensure that there are no object within 5 feet of the robot, and be prepar
ed to hit the emergency stop switch!
Is the area around the robot clear? [y, n]:y
The robot will now move forward and then turn
Did the robot move forward and then turn? [y, n]:y
Testing odometry
X Position (should be non-zero): 66
Y Position (should be near-zero or zero): 229
Theta (should be non-zero): 2495
Did the results match what was expected? [y, n]:y
Did the sonars shut off? [y,n]:y
COMPLETE: Test was a success!
```

An example run of a qualitative functional test.

---

## Project Overview

### Demo – Controlled Movement

---

```
while api.getRangeSensors()[16].getValue(0) > 12:
    time.sleep(1)
    api.getVelocityActuators()[0].setVelocity(50,50)
    api.getVelocityActuators()[0].setVelocity(0,0)
```

---

## Project Overview

### Demo – Dancing!

---

```
for i in xrange(3):
self._rap.getVelocityActuators()[0].setVelocity(100,-100) == 1
time.sleep(3)
self._rap.getVelocityActuators()[0].setVelocity(-100,100) == 1
time.sleep(3)
self._rap.getVelocityActuators()[0].setVelocity(150,-150) == 1
time.sleep(3)
self._rap.getVelocityActuators()[0].setVelocity(-150,150) == 1
time.sleep(3)
self._rap.getVelocityActuators()[0].setVelocity(-200,200) == 1
time.sleep(3)
self._rap.getVelocityActuators()[0].setVelocity(200,-200) == 1
time.sleep(3)
self._rap.getVelocityActuators()[0].setVelocity(250,-250) == 1
time.sleep(3)
self._rap.getVelocityActuators()[0].setVelocity(-250,250) == 1
time.sleep(3)
```

## Results and Lessons

### Results – Orig. Picture of Success

---

- Follow XP and course practices
    - Meet all deliverable expectations
    - Pair programming
  - Significant behavior on AIBO and ER1
  - Client should use it within a year
  - One additional device and one additional robot added within a year
  - Client satisfied
-

## Results and Lessons

### Results – Pict. of Success Changes

---

- Project focus changed from the AIBO to the Nomad Scout
    - Complexity of the AIBO
    - Group familiarity with the Nomad Scout
  - Client's focus changed from the AIBO to the ER1
- 

## Results and Lessons

### Results – Success?

---

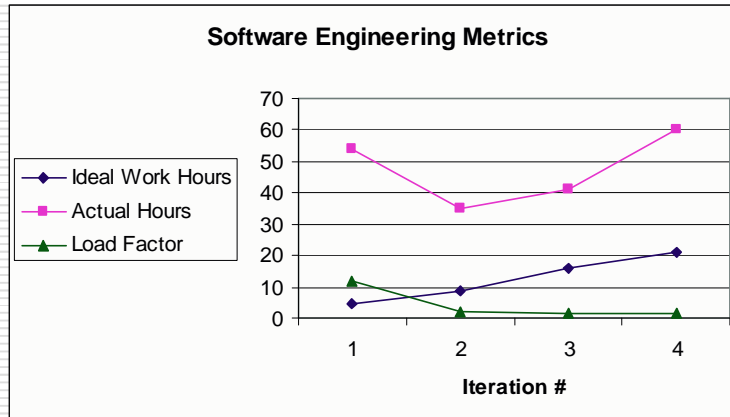

- XP and course practices? YES
  - Significant behavior on Nomad? YES
  - Client use within a year? TBD
  - Additional device/robot? TBD
  - Client satisfied? TBD
  - Get an A in this course? WE HOPE SO
-

## Results and Lessons

### Results – Metrics

---

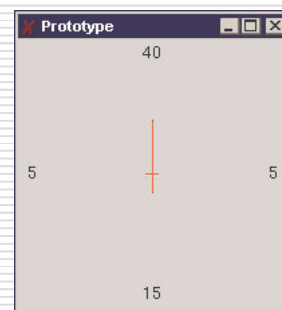

## Results and Lessons

### Changes – Prototype Results

---

- Provided early image of the project
- Redirected project
  - Platform AIBO -> Nomad Scouts
  - Actuator API -> Sensor API specifically Range Finder

## Results and Lessons

### Changes – Low Time Estimation

---

- Experience in Computer Networks gave us better skill in estimating time requirements for network programming.
  - Determined we had underestimated our time needed for teleoperation and network communication.
  - Dropped priority of involved stories as a result.
- 

## Results and Lessons

### Changes – Team Member Dropped

---

- Left group with two members.
  - Caused drop in available time resulting in lower prioritization of more requirements.
    - Debugging framework
    - Logging driver
    - Information GUI
  - Focused on achieving picture of success when slimming down project.
-

## Results and Lessons

### Strengths

---

- Loss of a Partner
    - Required replanning the project to bring it within scope of a two person group
  - Consistently meeting deadlines
  - Keeping client informed
    - Weekly status meetings
    - Website
- 

## Results and Lessons

### Strengths

---

- We have been partners on previous projects
    - Work well together
    - Easy to recognize and capitalize on our strengths as developers
  - Centralized Project Wiki
    - Kept team members and clients universally updated
    - Acted as a repository for our course documents
    - Kept meeting minutes in case someone was absent or we needed to refer to what was said
    - Common source for resource material
-

## Results and Lessons

### Weaknesses

---

- We have been partners on previous projects
    - Easy to fall into old habits, which did not fit within the XP framework for development.
  - Time
    - Difficult to consistently find common time to work together.
- 

## Results and Lessons

### Weaknesses

---

- Pair Programming
    - Did not schedule time for pair programming
    - Hard to find overlapping free time that was not taken up with class assignments
  - Stories
    - Difficulty understanding scope of stories
    - Difficulty forming comprehensive stories for project
-

## Results and Lessons

### Lessons Learned

---

- Nomad Serial Interface
    - Written without originally testing on the robot
    - Unit and functional tests simulated communication and checked bounds
    - Used traces from C-API communications
    - Worked the first time!
  - Lesson: XP Works!
- 

## Results and Lessons

### Lessons Learned

---

- Regular review of results and revision of requirements
    - Prototype – new direction
    - Learning more information – revise story priority
    - Loosing a partner – dropped stories
  - Consistent meetings
  - Robots are hard!
-

## Conclusions

---
