

Principles of Software Construction: Objects, Design, and Concurrency

Part 3: Design case studies

Introduction to concurrency and GUIs

Charlie Garrod

Michael Hilton

Administrivia

- Homework 4a due tonight at 11:59 p.m.
- Homework 4b due Thursday, October 19th
- Reading due Tuesday: UML and Patterns Chapters 26.1 and 26.4
- Still need Midterm 1?
- All quiet on the Piazza front?

Key concepts from Tuesday

Key concepts from Tuesday

- Revise, revise, revise: Refactoring and anti-patterns
- More testing
 - Test coverage metrics
- Static analysis

Key concepts from yesterday's recitation

- Discovering design patterns
- Observer design pattern

Observer pattern (a.k.a. publish/subscribe)

- Problem: Must notify other objects (observers) without becoming dependent on the objects receiving the notification
- Solution: Define a small interface to define how observers receive a notification, and only depend on the interface
- Consequences:
 - Loose coupling between observers and the source of the notifications
 - Notifications can cause a cascade effect

See `edu.cmu.cs.cs214.rec06.alarmclock.AlarmListener...`

Learning goals for today

- Understand basic Java techniques and challenges for concurrent programming
- Understand thread model in Swing
- Understand the design challenges and common solutions for Graphical User Interfaces (GUIs)
- Understand event-based programming
- Understand and recognize the design patterns used and how those design patterns achieve design goals.
 - Observer pattern

Today

- Observer pattern
- Introduction to concurrency
- Introduction to GUIs

A thread is a thread of execution

- Multiple threads in the same program concurrently
- Threads share the same memory address space

Threads vs. processes

- Threads are lightweight; processes are heavyweight
- Threads share address space; processes don't
- Threads require synchronization; processes don't
- It's unsafe to kill threads; safe to kill processes

Reasons to use threads

- Performance needed for blocking activities
- Performance on multi-core processors
- Natural concurrency in the real-world
- Existing multi-threaded, managed run-time environments

A simple threads example

```
public interface Runnable { // java.lang.Runnable
    public void run();
}

public static void main(String[] args) {
    int n = Integer.parseInt(args[0]); // Number of threads;

    Runnable greeter = new Runnable() {
        public void run() {
            System.out.println("Hi mom!");
        }
    };
    for (int i = 0; i < n; i++) {
        new Thread(greeter).start();
    }
}
```

A simple threads example

```
public interface Runnable { // java.lang.Runnable
    public void run();
}

public static void main(String[] args) {
    int n = Integer.parseInt(args[0]); // Number of threads;

    Runnable greeter = () -> System.out.println("Hi mom!");
    for (int i = 0; i < n; i++) {
        new Thread(greeter).start();
    }
}
```

A simple threads example

```
public interface Runnable { // java.lang.Runnable
    public void run();
}

public static void main(String[] args) {
    int n = Integer.parseInt(args[0]); // Number of threads;

    for (int i = 0; i < n; i++) {
        new Thread(() -> System.out.println("Hi mom!")).start();
    }
}
```

Aside: Anonymous inner class scope in Java

```
public interface Runnable { // java.lang.Runnable
    public void run();
}

public static void main(String[] args) {
    int n = Integer.parseInt(args[0]); // Number of threads;

    for (int i = 0; i < n; i++) {
        new Thread(() -> System.out.println("T" + i)).start();
    }
}
```

won't compile
because i mutates

Aside: Anonymous inner class scope in Java

```
public interface Runnable { // java.lang.Runnable
    public void run();
}

public static void main(String[] args) {
    int n = Integer.parseInt(args[0]); // Number of threads;

    for (int i = 0; i < n; i++) {
        int j = i; // j unchanging within each loop
        new Thread(() -> System.out.println("T" + j)).start();
    }
}
```

j is effectively final

Threads for performance

- Generating cryptarithms from a 344-word corpus
 - Test all consecutive 3-word sequences: $A + B = C$ (342 possibilities)

Number of threads	Seconds to run
1	22.0
2	13.5
3	11.7
4	10.8

Shared mutable state requires synchronization

- Three basic choices:
 1. Don't mutate: share only immutable state
 2. Don't share: isolate mutable state in individual threads
 3. If you must share mutable state: synchronize properly

The challenge of synchronization

- Not enough synchronization: *safety failure*
 - Incorrect computation
- Too much synchronization: *liveness failure*
 - No computation at all

Today

- Observer pattern
- Introduction to concurrency
- Introduction to GUIs

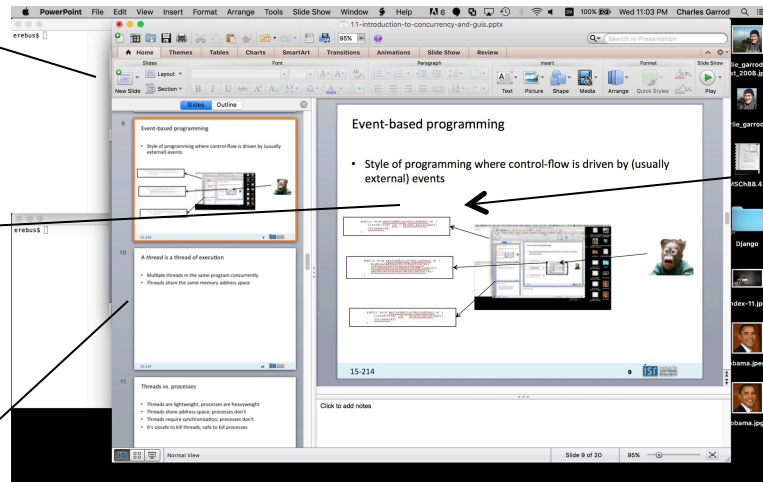

Event-based programming

- Style of programming where control-flow is driven by (usually external) events

```
public void performAction(ActionEvent e) {  
    List<String> lst = Arrays.asList(bar);  
    foo.peek(42)  
}
```

```
public void performAction(ActionEvent e) {  
    bigBloatedPowerPointFunction(e);  
    withANameSoLongIMadeItTwoMethods(e);  
    yesIKnowJavaDoesntWorkLikeThat(e);  
}
```

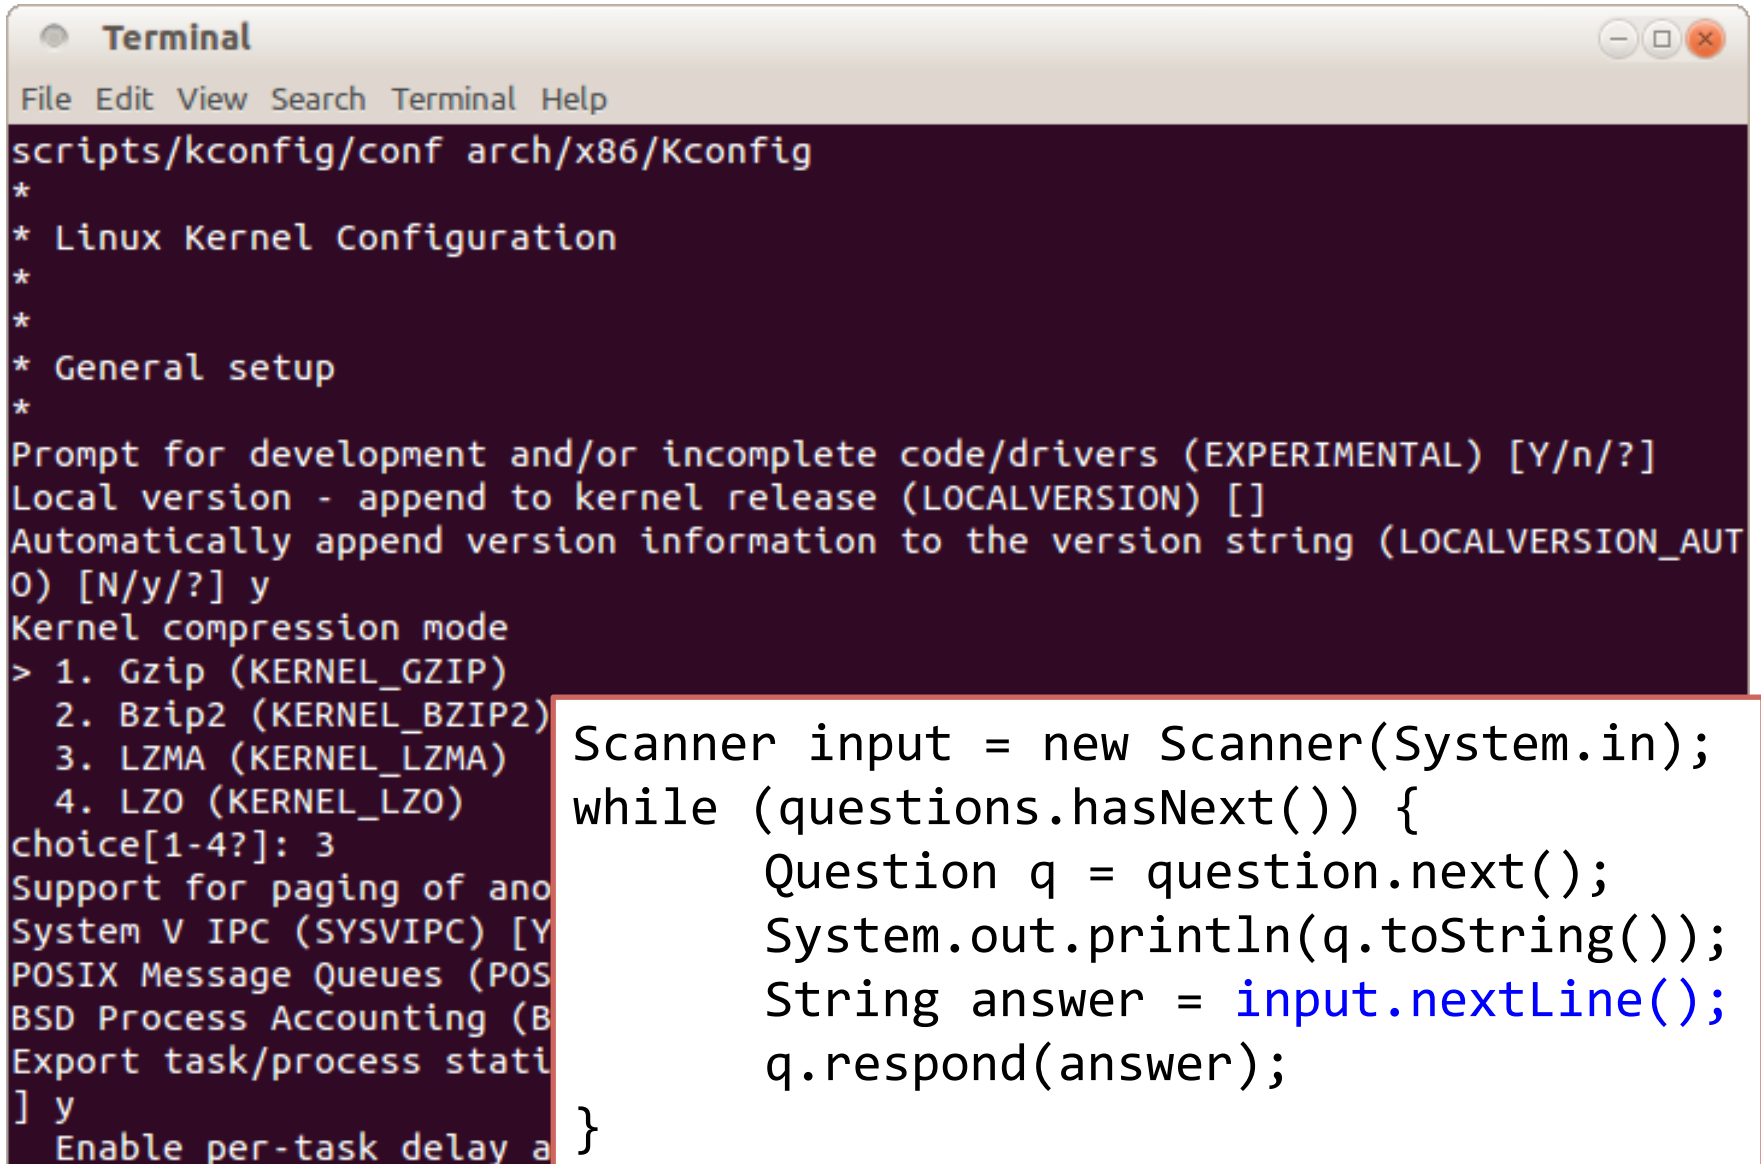

```
public void performAction(ActionEvent e) {  
    List<String> lst = Arrays.asList(bar);  
    foo.peek(40)  
}
```

Examples of events in GUIs

- User clicks a button, presses a key
 - User selects an item from a list, an item from a menu
 - Mouse hovers over a widget, focus changes
 - Scrolling, mouse wheel turned
 - Resizing a window, hiding a window
 - Drag and drop
-
- A packet arrives from a web service, connection drops, ...
 - System shutdown, ...

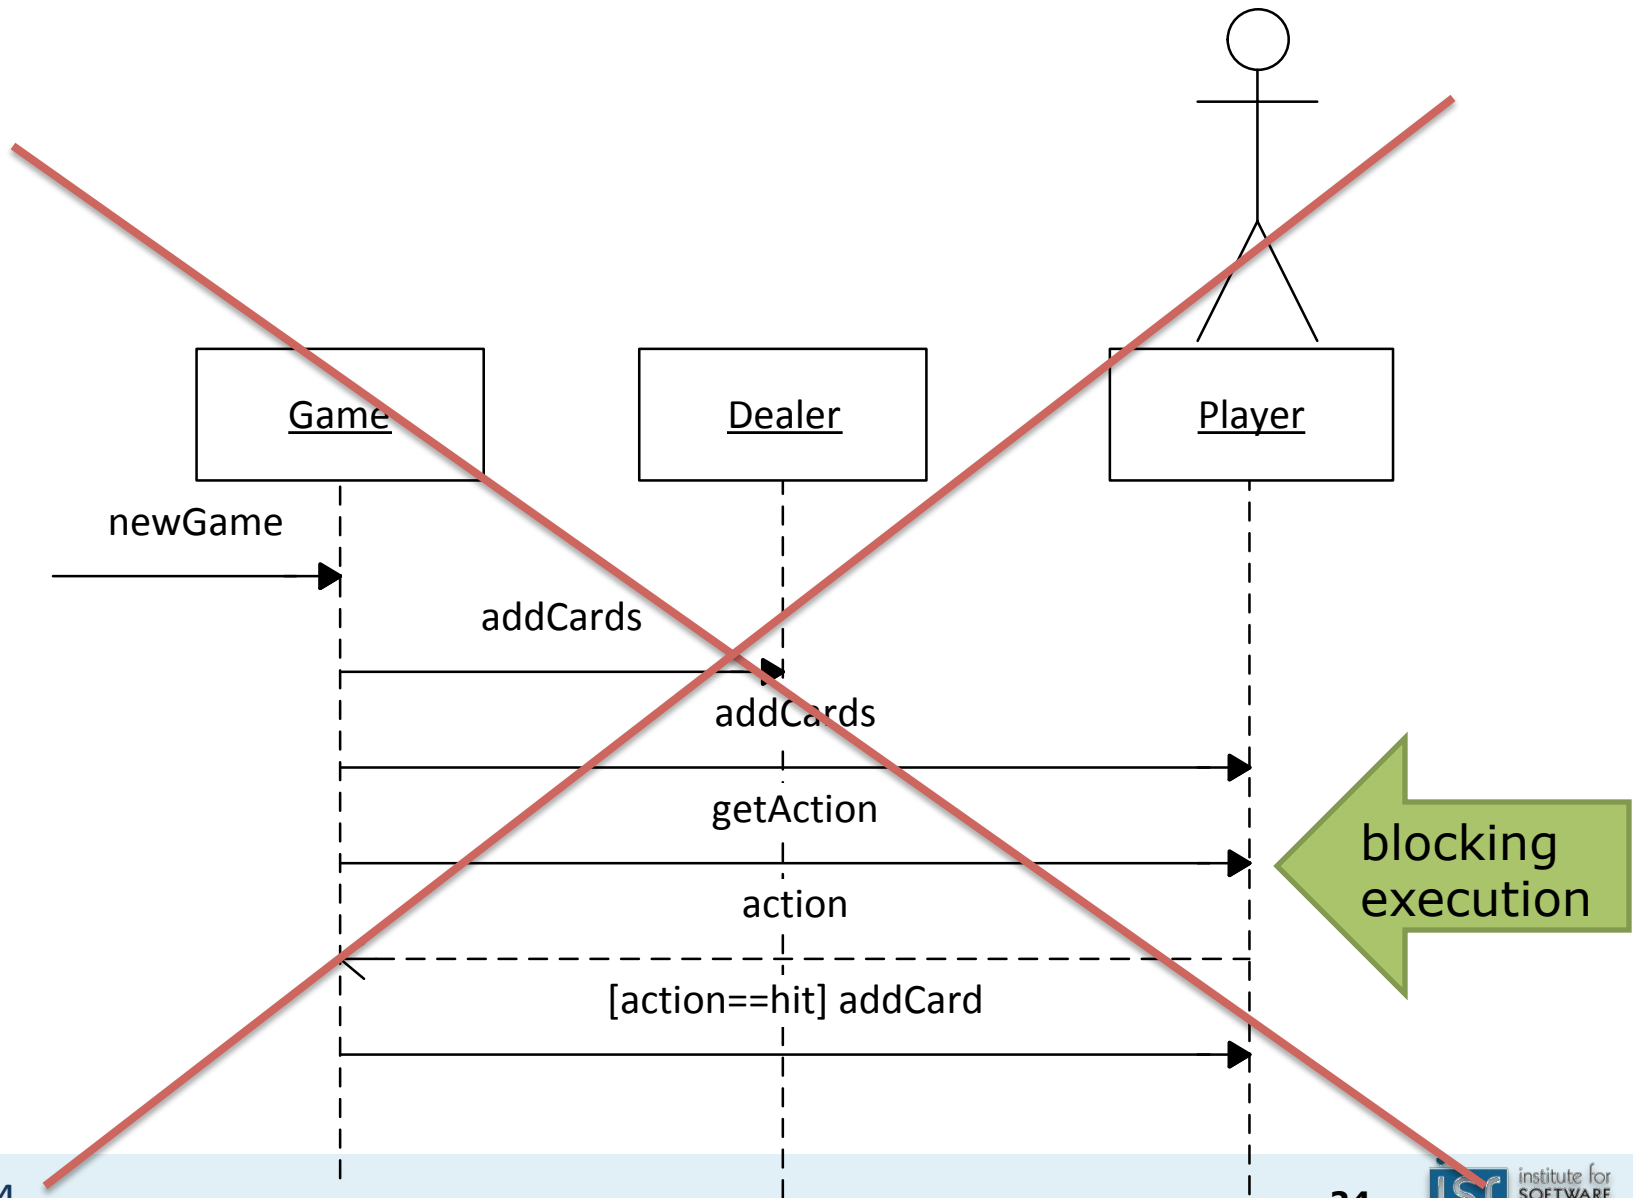

Blocking interaction with command-line interfaces

```
Terminal
File Edit View Search Terminal Help
scripts/kconfig/conf arch/x86/Kconfig
*
* Linux Kernel Configuration
*
*
* General setup
*
Prompt for development and/or incomplete code/drivers (EXPERIMENTAL) [Y/n/?]
Local version - append to kernel release (LOCALVERSION) []
Automatically append version information to the version string (LOCALVERSION_AUTO) [N/y/?] y
Kernel compression mode
> 1. Gzip (KERNEL_GZIP)
   2. Bzip2 (KERNEL_BZIP2)
   3. LZMA (KERNEL_LZMA)
   4. LZO (KERNEL_LZO)
choice[1-4?]: 3
Support for paging of anonymous memory (SWAP) [Y/n/?] y
System V IPC (SYSVIPC) [Y/n/?] y
POSIX Message Queues (POSIX_MQ) [Y/n/?] y
BSD Process Accounting (BSD_PROCESS_ACCT) [Y/n/?] y
Export task/process statistics [Y/n/?] y
Enable per-task delay accounting [Y/n/?] y
```

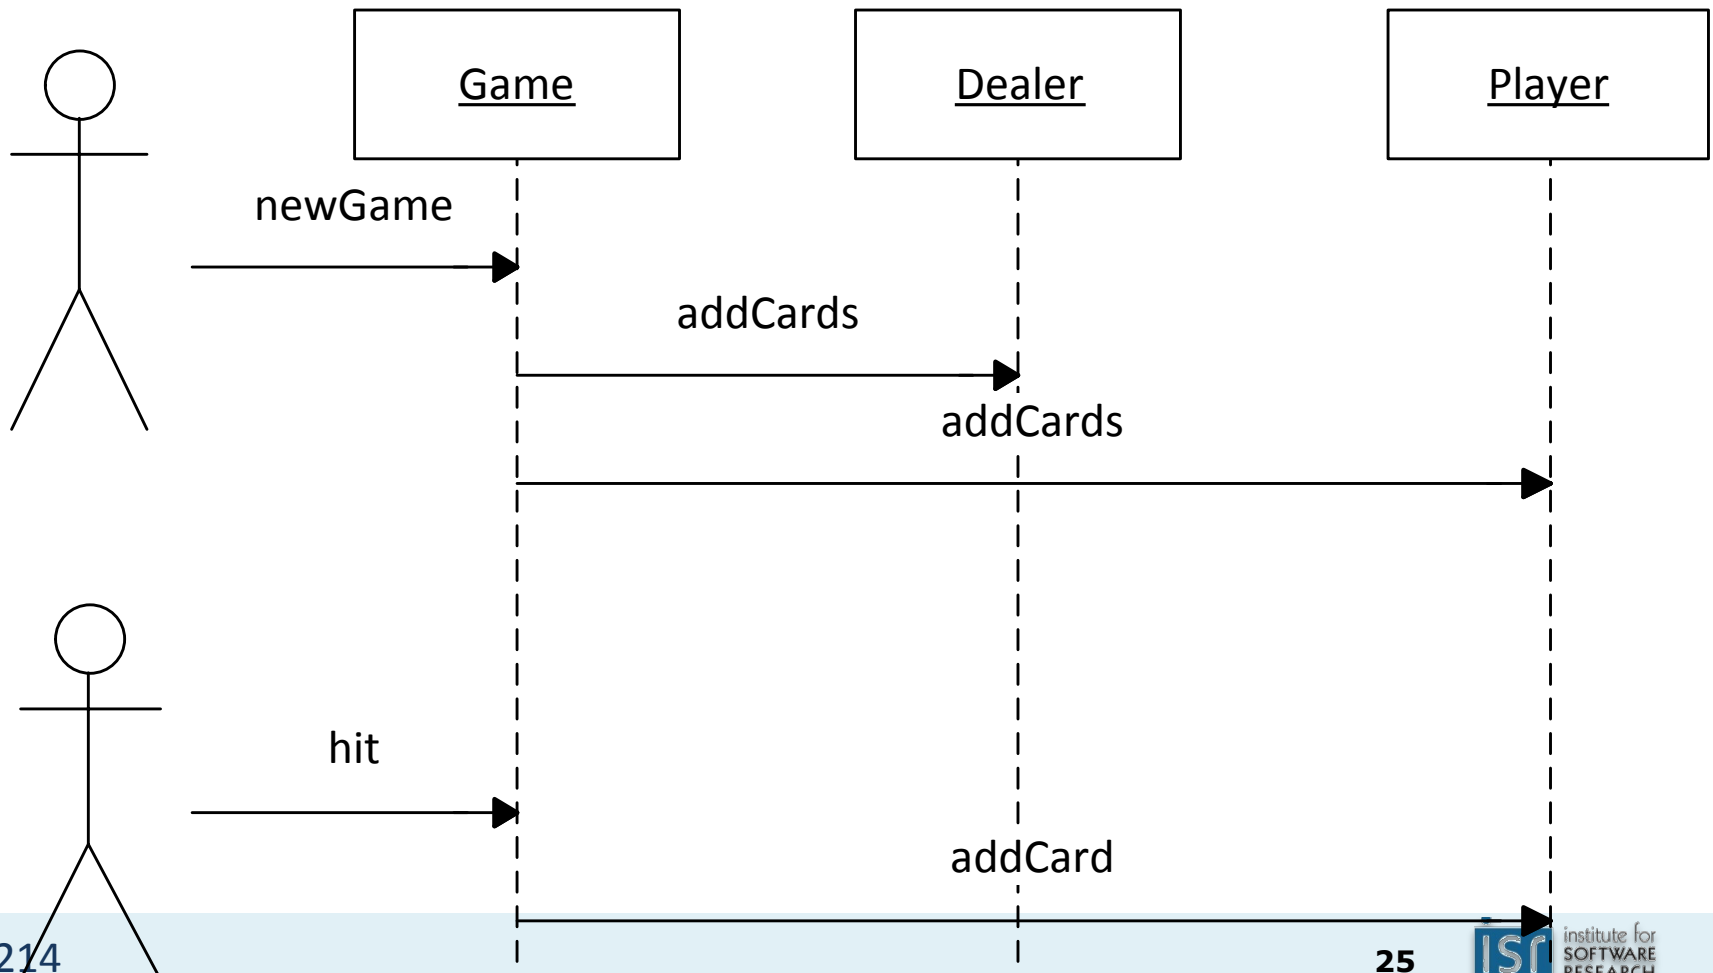

```
Scanner input = new Scanner(System.in);
while (questions.hasNext()) {
    Question q = question.next();
    System.out.println(q.toString());
    String answer = input.nextLine();
    q.respond(answer);
}
```

Blocking interactions with users

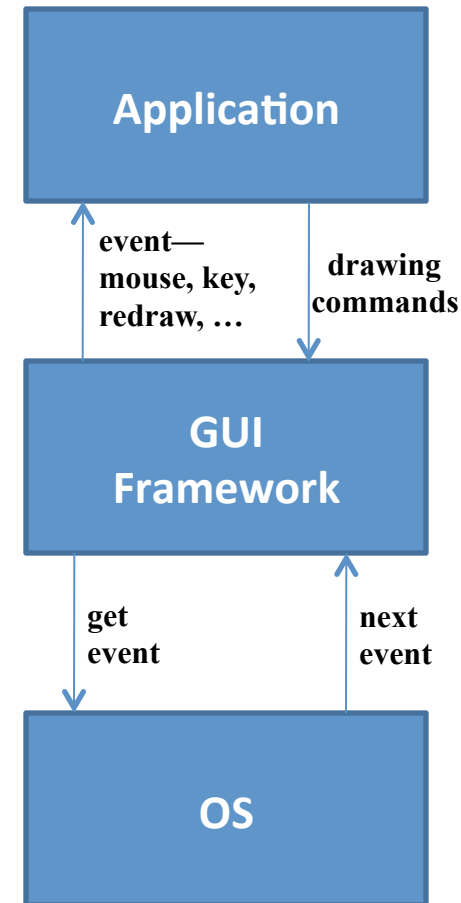

Interactions with users through events

- Do not block waiting for user response
- Instead, react to user events

An event-based GUI with a GUI framework

- Setup phase
 - Describe how the GUI window should look
 - Register observers to handle events
- Execution
 - Framework gets events from OS, processes events
 - Your code is mostly just event handlers

See [edu.cmu.cs.cs214.rec06.alarmclock.AlarmWindow...](#)

GUI frameworks in Java

- AWT – obsolete except as a part of Swing
- Swing – the most widely used, by far
- SWT – Little used outside of Eclipse
- JavaFX – Billed as a replacement for Swing
 - Released 2008 – has yet to gain traction
- A bunch of modern (web & mobile) frameworks
 - e.g., Android

GUI programming is inherently multi-threaded

- Swing *Event dispatch thread* (EDT) handles all GUI events
 - Mouse events, keyboard events, timer events, etc.
- No other time-consuming activity allowed on the EDT
 - Violating this rule can cause liveness failures

Ensuring all GUI activity is on the EDT

- Never make a Swing call from any other thread
 - "Swing calls" include Swing constructors
- If not on EDT, make Swing calls with `invokeLater`:

```
public static void main(String[] args) {  
    SwingUtilities.invokeLater(() -> new Test().setVisible(true));  
}
```

Callbacks execute on the EDT

- You are a guest on the Event Dispatch Thread!
 - Don't abuse the privilege
- If > a few ms of work to do, do it *off* the EDT
 - `javax.swing.SwingWorker` designed for this purpose

Components of a Swing application

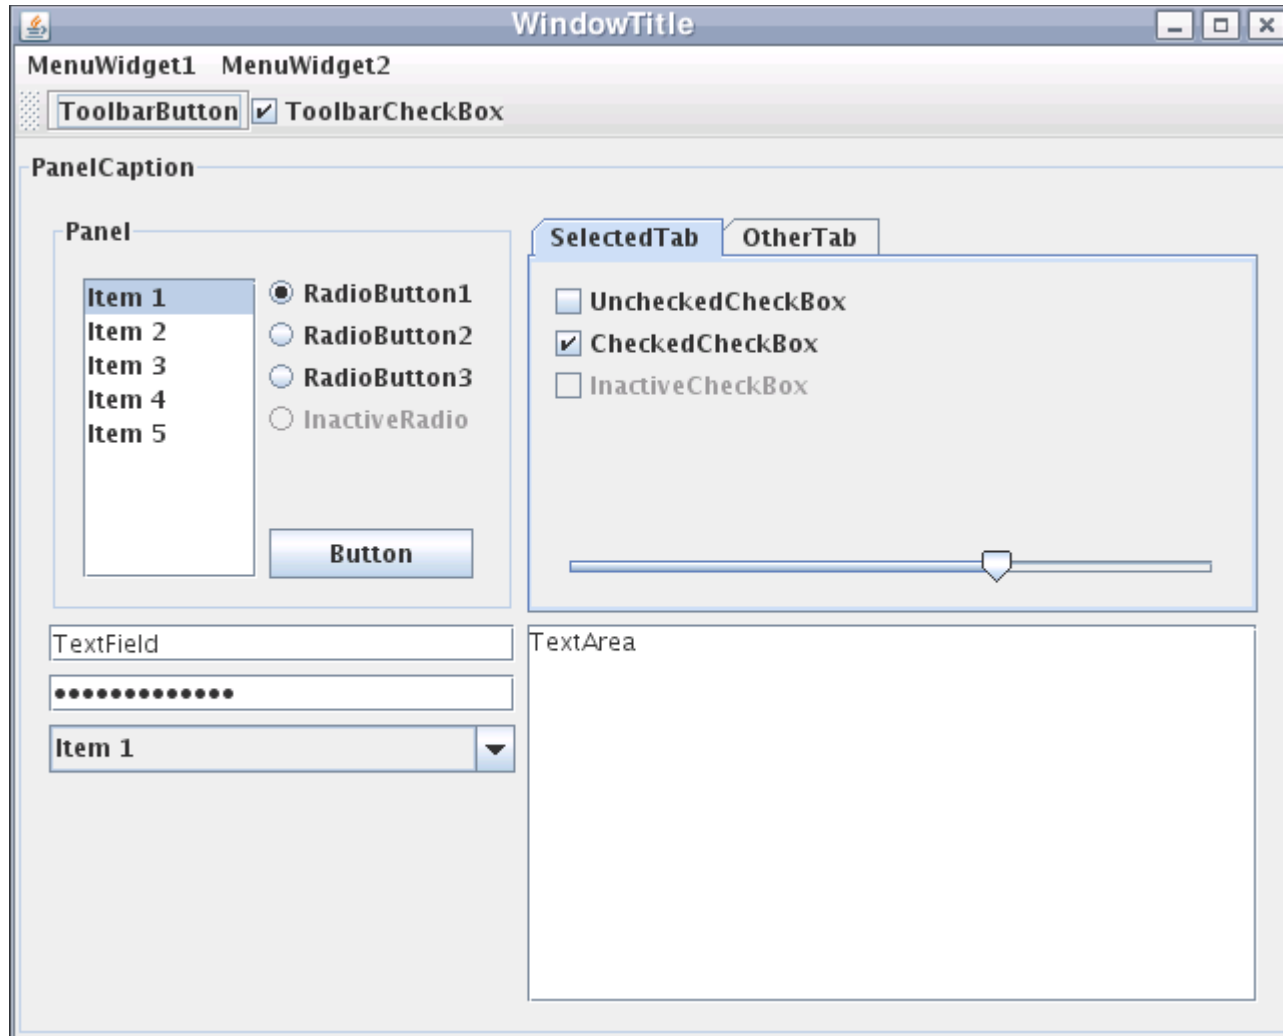

JFrame

JPanel

JButton

JTextField

...

Swing has many *widgets*

- JLabel
 - JButton
 - JCheckBox
 - JChoice
 - JRadioButton
 - JTextField
 - JTextArea
 - JList
 - JScrollBar
 - ... and more
-
- JFrame is the Swing Window
 - JPanel (a.k.a. a pane) is the container to which you add your components (or other containers)

To create a simple Swing application

- Make a window (a `JFrame`)
- Make a container (a `JPanel`)
 - Put it in the window
- Add components (buttons, boxes, etc.) to the container
 - Use layouts to control positioning
 - Set up observers (a.k.a. listeners) to respond to events
 - Optionally, write custom widgets with application-specific display logic
- Set up the window to display the container
- Then wait for events to arrive...

E.g., creating a button

```
//static public void main...  
JFrame window = ...
```

```
JPanel panel = new JPanel();  
window.setContentPane(panel);
```

```
JButton button = new JButton("Click me");  
button.addActionListener(new ActionListener() {  
    public void actionPerformed(ActionEvent e) {  
        System.out.println("Button clicked");  
    }  
});
```

```
panel.add(button);
```

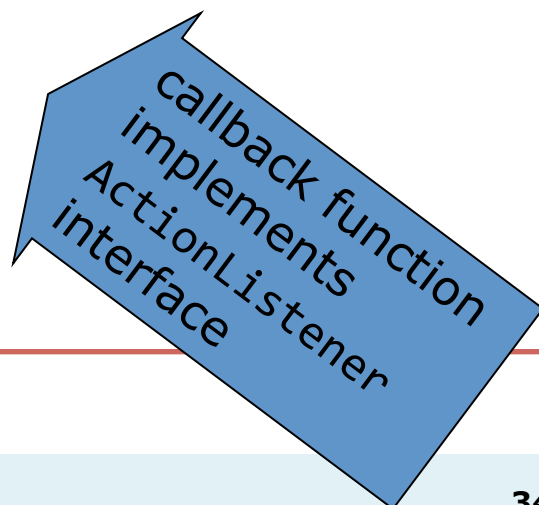

```
window.setVisible(true);
```

panel to hold
the button

register callback
function

callback function
implements
ActionListener
interface

E.g., creating a button

```
//static public void main...  
JFrame window = ...
```

```
JPanel panel = new JPanel();  
window.setContentPane(panel);
```

```
JButton button = new JButton("Click me");  
button.addActionListener( (e) -> {  
    System.out.println("Button clicked");  
});  
panel.add(button);
```

```
window.setVisible(true);
```

panel to hold
the button

register callback
function

callback function
implements
ActionListener
interface

The javax.swing.ActionListener

- Listeners are objects with callback functions
 - Can be registered to handle events on widgets
 - All registered widgets are called if event occurs

```
interface ActionListener {  
    void actionPerformed(ActionEvent e);  
}
```

```
class ActionEvent {  
    int when;  
    String actionCommand;  
    int modifiers;  
    Object source();  
    int id;  
    ...  
}
```

Button design discussion

- Button implementation should be reusable but customizable
 - Different button label, different event-handling
- Must decouple button's action from the button itself
- Listeners are separate independent objects
 - A single button can have multiple listeners
 - Multiple buttons can share the same listener

Swing has many event listener interfaces

- ActionListener
- AdjustmentListener
- FocusListener
- ItemListener
- KeyListener
- MouseListener
- TreeExpansionListener
- TextListener
- WindowListener
- ...

```
class ActionEvent {  
    int when;  
    String actionCommand;  
    int modifiers;  
    Object source();  
    int id;
```

```
interface ActionListener {  
    void actionPerformed(ActionEvent e);  
}
```

Design discussion: Decoupling your game from your GUI

Next week

- Design case studies
