1. What is the idiom for moving along a path?

___________________________________________

2. Consider the world below, which has a red path and a yellow path that together form a circle:

![Image of a world with red and yellow paths forming a circle]

The kodu wants to go around and around the circle. How many states will this require?  ____

3. Draw a state machine diagram to describe your solution:
4. Write down the rules to make the kodu follow the circular trajectory:

5. Look at the paths in the ForkedPath1 world. View the world in the editor; don’t run it. This will allow you to see the nodes and links that make up each path. A node looks like a sphere, and a link is a straight segment that connects two nodes.

   a. How many nodes are in the red path? ______
   b. How many links are in the red path? ______
   c. How many nodes are in the white path? ______
   d. How many links are in the white path? ______
   e. In general, if a path has N nodes and no loops, how many links does it have? ______
   f. How many nodes are in the orange path? ______
   g. How many links are in the orange path? ______
   h. Does this agree with your formula in part (e)? Why or why not?
