The Most Powerful Attacker

Execution with an Attacker

$$P, P_I \triangleright C \rightarrow C'$$

- Selected principal(s): I
- Generic capabilities: P_I
 - Well-typed
 - AC-valid
- Modeled completely within MSR

The Dolev-Yao Intruder

- **Specific** protocol suite P_{DY}
- Underlies every protocol analysis tool
- **Completeness still unproved !!!**

Capabilities of the D-Y Intruder

- Intercept / emit messages
- Split / form pairs
- Decrypt / encrypt with known key
- Look up public information
- Generate fresh data

DY Intruder – Data access

- $M_I(t)$: Intruder knowledge

$$\left[\forall A: \text{princ}. \bullet \rightarrow M_I(A) \right]^I$$

$$\left[\begin{array}{l} \forall A: \text{princ} \\ \forall k: \text{shK } I \ A \end{array} \bullet \rightarrow M_I(k) \right]^I + \text{dual}$$

$$\left[\begin{array}{l} \forall A: \text{princ} \\ \forall k: \text{pubK } A \end{array} \bullet \rightarrow M_I(k) \right]^I \left[\begin{array}{l} \forall k: \text{pubK } I \\ \forall k': \text{privK } k \end{array} \bullet \rightarrow M_I(k') \right]^I$$

- No nonces, no other keys, ...

DY Intruder – Data Generation

- Safe data

$$\left[\bullet \rightarrow \exists n:\text{nonce}. M_I(n) \right]^I \quad \left[\bullet \rightarrow \exists m:\text{msg}. M_I(m) \right]^I$$

- Anything else ?

$$\left[\forall A, B:\text{princ}. \bullet \rightarrow \exists k:\text{shK } A \ B. M_I(k) \right]^I \quad ???$$

- It depends on the protocol !!!
 - Automated generation ?

DY Intruder Stretches AC to Limit

Completeness of D-Y Intruder

- If $P \triangleright [S]_{\Sigma}^R \rightarrow [S']_{\Sigma'}^{R'}$
with all well-typed and AC-valid

- Then

$$\underline{P}, P_{DY} \triangleright [\underline{S}]_{\underline{\Sigma}}^R \rightarrow [\underline{S'}]_{\underline{\Sigma'}}^{R'}$$

Encoding of P, S, Σ

P Remove roles anchored on I

S Map I 's state / mem. pred. using M_I

Σ Remove I 's role state pred.; add M_I

Encoding of R

- No encoding on structure of R
 - Lacks context!
- Encoding on AC-derivation for R

$$A :: \Sigma \parallel - R$$

- Associate roles from P_{DY} to each AC rule

Completeness proof

- Induction on execution sequence
- Simulate every step with P_{DY}
 - Rule application
 - Induction on AC-derivation for R
 - Every AC-derivation maps to execution sequence relative to P_{DY}
 - Rule instantiation
 - AC-derivations preserved
 - Encoding unchanged

Consequences

- Justifies design of current tools
- Support optimizations
 - D-Y intr. often too general/inefficient
 - Generic optimizations
 - *Per protocol* optimizations
 - Restrictive environments
- Caps multi-intruder situations
