

# 10-601 Introduction to Machine Learning

Machine Learning Department  
School of Computer Science  
Carnegie Mellon University

# Regularization + Neural Networks

Matt Gormley  
Lecture 11  
Feb. 20, 2019

# Reminders

- **Homework 4: Logistic Regression**
  - Out: Fri, Feb 15
  - Due: Fri, Mar 1 at 11:59pm
- **Midterm Exam 1**
  - Thu, Feb 21, 6:30pm – 8:00pm
- **Today's In-Class Poll**
  - <http://p11.mlcourse.org>
- **HW3 grades published**
- **Crowdsourcing Exam Questions**

# **NON-LINEAR FEATURES**

# Nonlinear Features

- aka. “nonlinear basis functions”
- So far, input was always  $\mathbf{x} = [x_1, \dots, x_M]$
- **Key Idea:** let input be some function of  $\mathbf{x}$ 
  - original input:  $\mathbf{x} \in \mathbb{R}^M$
  - new input:  $\mathbf{x}' \in \mathbb{R}^{M'}$  where  $M' > M$  (usually)
  - define  $\mathbf{x}' = b(\mathbf{x}) = [b_1(\mathbf{x}), b_2(\mathbf{x}), \dots, b_{M'}(\mathbf{x})]$   
where  $b_i : \mathbb{R}^M \rightarrow \mathbb{R}$  is any function

- **Examples:** ( $M = 1$ )

polynomial

$$b_j(x) = x^j \quad \forall j \in \{1, \dots, J\}$$

radial basis function

$$b_j(x) = \exp\left(\frac{-(x - \mu_j)^2}{2\sigma_j^2}\right)$$

sigmoid

$$b_j(x) = \frac{1}{1 + \exp(-\omega_j x)}$$

log

$$b_j(x) = \log(x)$$

**For a linear model:**  
still a linear function  
of  $b(\mathbf{x})$  even though a  
nonlinear function of  
 $\mathbf{x}$

**Examples:**

- Perceptron
- Linear regression
- Logistic regression

# Example: Linear Regression

**Goal:** Learn  $y = \mathbf{w}^\top \mathbf{f}(\mathbf{x}) + b$   
where  $\mathbf{f}(\cdot)$  is a polynomial  
basis function

true “unknown”  
target function is  
linear with  
negative slope  
and gaussian  
noise

# Example: Linear Regression

**Goal:** Learn  $y = \mathbf{w}^\top \mathbf{f}(\mathbf{x}) + b$   
where  $\mathbf{f}(\cdot)$  is a polynomial  
basis function

true “unknown”  
target function is  
linear with  
negative slope  
and gaussian  
noise

# Example: Linear Regression

**Goal:** Learn  $y = \mathbf{w}^\top \mathbf{f}(\mathbf{x}) + b$   
where  $\mathbf{f}(\cdot)$  is a polynomial  
basis function

true “unknown”  
target function is  
linear with  
negative slope  
and gaussian  
noise

# Example: Linear Regression

**Goal:** Learn  $y = \mathbf{w}^\top \mathbf{f}(\mathbf{x}) + b$   
where  $\mathbf{f}(\cdot)$  is a polynomial  
basis function

true “unknown”  
target function is  
linear with  
negative slope  
and gaussian  
noise

# Example: Linear Regression

**Goal:** Learn  $y = \mathbf{w}^\top \mathbf{f}(\mathbf{x}) + b$   
where  $\mathbf{f}(\cdot)$  is a polynomial  
basis function

true “unknown”  
target function is  
linear with  
negative slope  
and gaussian  
noise

# Example: Linear Regression

**Goal:** Learn  $y = \mathbf{w}^T \mathbf{f}(\mathbf{x}) + b$   
where  $\mathbf{f}(\cdot)$  is a polynomial  
basis function

true “unknown”  
target function is  
linear with  
negative slope  
and gaussian  
noise

# Example: Linear Regression

**Goal:** Learn  $y = \mathbf{w}^T \mathbf{f}(\mathbf{x}) + b$   
where  $\mathbf{f}(\cdot)$  is a polynomial  
basis function

true “unknown”  
target function is  
linear with  
negative slope  
and gaussian  
noise

# Over-fitting

Root-Mean-Square (RMS) Error:  $E_{\text{RMS}} = \sqrt{2E(\mathbf{w}^*)/N}$

# Polynomial Coefficients

	$M = 0$	$M = 1$	$M = 3$	$M = 9$
$\theta_0$	0.19	0.82	0.31	0.35
$\theta_1$		-1.27	7.99	232.37
$\theta_2$			-25.43	-5321.83
$\theta_3$			17.37	48568.31
$\theta_4$				-231639.30
$\theta_5$				640042.26
$\theta_6$				-1061800.52
$\theta_7$				1042400.18
$\theta_8$				-557682.99
$\theta_9$				125201.43

# Example: Linear Regression

**Goal:** Learn  $y = \mathbf{w}^\top \mathbf{f}(\mathbf{x}) + b$   
where  $\mathbf{f}(\cdot)$  is a polynomial  
basis function

true “unknown”  
target function is  
linear with  
negative slope  
and gaussian  
noise

# Example: Linear Regression

**Goal:** Learn  $y = \mathbf{w}^T \mathbf{f}(\mathbf{x}) + b$   
where  $\mathbf{f}(\cdot)$  is a polynomial  
basis function

Same as before, but now  
with  $N = 100$  points

true “unknown”  
target function is  
linear with  
negative slope  
and gaussian  
noise

# REGULARIZATION

# Overfitting

**Definition:** The problem of **overfitting** is when the model captures the noise in the training data instead of the underlying structure

Overfitting can occur in all the models we've seen so far:

- Decision Trees (e.g. when tree is too deep)
- KNN (e.g. when  $k$  is small)
- Perceptron (e.g. when sample isn't representative)
- Linear Regression (e.g. with nonlinear features)
- Logistic Regression (e.g. with many rare features)

# Motivation: Regularization

## Example: Stock Prices

- Suppose we wish to predict Google's stock price at time  $t+1$
- **What features should we use?**  
(putting all computational concerns aside)
  - Stock prices of all other stocks at times  $t, t-1, t-2, \dots, t-k$
  - Mentions of Google with positive / negative sentiment words in all newspapers and social media outlets
- Do we believe that **all** of these features are going to be useful?

# Motivation: Regularization

- **Occam's Razor:** prefer the simplest hypothesis
- What does it mean for a hypothesis (or model) to be **simple**?
  1. small number of features (**model selection**)
  2. small number of “important” features (**shrinkage**)

# Regularization

## *Chalkboard*

- L2, L1, L0 Regularization
- Example: Linear Regression

# Regularization

## Question:

Suppose we are minimizing  $J'(\theta)$  where

$$J'(\theta) = J(\theta) + \lambda r(\theta)$$

As  $\lambda$  increases, the minimum of  $J'(\theta)$  will move...

- A. ...towards the midpoint between  $J'(\theta)$  and  $r(\theta)$
- B. ...towards a theta vector of negative infinities
- C. ...towards a theta vector of positive infinities
- D. ...towards the minimum of  $J'(\theta)$
- E. ...towards the minimum of  $r(\theta)$

# Regularization Exercise

## *In-class Exercise*

1. Plot train error vs. regularization weight (cartoon)
2. Plot test error vs. regularization weight (cartoon)

# Regularization

## Question:

Suppose we are minimizing  $J'(\theta)$  where

$$J'(\theta) = J(\theta) + \lambda r(\theta)$$

As we increase  $\lambda$  from 0, the the validation error will...

- A. ...increase
- B. ...decrease
- C. ...first increase, then decrease
- D. ...first decrease, then increase
- E. ...stay the same

# Regularization

## Don't Regularize the Bias (Intercept) Parameter!

- In our models so far, the bias / intercept parameter is usually denoted by  $\theta_0$  -- that is, the parameter for which we fixed  $x_0 = 1$
- Regularizers always avoid penalizing this bias / intercept parameter
- Why? Because otherwise the learning algorithms wouldn't be invariant to a shift in the y-values

## Whitening Data

- It's common to *whiten* each feature by subtracting its mean and dividing by its variance
- For regularization, this helps all the features be penalized in the same units  
(e.g. convert both centimeters and kilometers to z-scores)

# Example: Logistic Regression

Training  
Data

Test  
Data

- For this example, we construct **nonlinear features** (i.e. feature engineering)
- Specifically, we add **polynomials up to order 9** of the two original features  $x_1$  and  $x_2$
- Thus our classifier is **linear** in the **high-dimensional feature space**, but the decision boundary is **nonlinear** when visualized in **low-dimensions** (i.e. the original two dimensions)

# Example: Logistic Regression

# Example: Logistic Regression

# Example: Logistic Regression

# Regularization as MAP

- L1 and L2 regularization can be interpreted as **maximum a-posteriori (MAP) estimation** of the parameters
- To be discussed later in the course...

# Takeaways

1. **Nonlinear basis functions** allow **linear models** (e.g. Linear Regression, Logistic Regression) to capture **nonlinear** aspects of the original input
2. Nonlinear features **require no changes to the model** (i.e. just preprocessing)
3. **Regularization** helps to avoid **overfitting**
4. **Regularization** and **MAP estimation** are equivalent for appropriately chosen priors

# Feature Engineering / Regularization Objectives

*You should be able to...*

- Engineer appropriate features for a new task
- Use feature selection techniques to identify and remove irrelevant features
- Identify when a model is overfitting
- Add a regularizer to an existing objective in order to combat overfitting
- Explain why we should **not** regularize the bias term
- Convert linearly inseparable dataset to a linearly separable dataset in higher dimensions
- Describe feature engineering in common application areas

# Neural Networks Outline

- **Logistic Regression (Recap)**
  - Data, Model, Learning, Prediction
- **Neural Networks**
  - A Recipe for Machine Learning
  - Visual Notation for Neural Networks
  - Example: Logistic Regression Output Surface
  - 2-Layer Neural Network
  - 3-Layer Neural Network
- **Neural Net Architectures**
  - Objective Functions
  - Activation Functions
- **Backpropagation**
  - Basic Chain Rule (of calculus)
  - Chain Rule for Arbitrary Computation Graph
  - Backpropagation Algorithm
  - Module-based Automatic Differentiation (Autodiff)

# NEURAL NETWORKS

## Background

# A Recipe for Machine Learning

1. Given training data:

$$\{\mathbf{x}_i, \mathbf{y}_i\}_{i=1}^N$$

2. Choose each of these:

– Decision function

$$\hat{\mathbf{y}} = f_{\theta}(\mathbf{x}_i)$$

– Loss function

$$\ell(\hat{\mathbf{y}}, \mathbf{y}_i) \in \mathbb{R}$$

*Face*

*Face*

*Not a face*

**Examples:** Linear regression,  
Logistic regression, Neural Network

**Examples:** Mean-squared error,  
Cross Entropy

## Background

# A Recipe for Machine Learning

1. Given training data:

$$\{\mathbf{x}_i, \mathbf{y}_i\}_{i=1}^N$$

2. Choose each of these:

– Decision function

$$\hat{\mathbf{y}} = f_{\boldsymbol{\theta}}(\mathbf{x}_i)$$

– Loss function

$$\ell(\hat{\mathbf{y}}, \mathbf{y}_i) \in \mathbb{R}$$

3. Define goal:

$$\boldsymbol{\theta}^* = \arg \min_{\boldsymbol{\theta}} \sum_{i=1}^N \ell(f_{\boldsymbol{\theta}}(\mathbf{x}_i), \mathbf{y}_i)$$

4. Train with SGD:

(take small steps  
opposite the gradient)

$$\boldsymbol{\theta}^{(t+1)} = \boldsymbol{\theta}^{(t)} - \eta_t \nabla \ell(f_{\boldsymbol{\theta}}(\mathbf{x}_i), \mathbf{y}_i)$$

## Background

1. Given training data

$$\{\mathbf{x}_i, \mathbf{y}_i\}_{i=1}^N$$

2. Choose each of the

– Decision function

$$\hat{\mathbf{y}} = f_{\boldsymbol{\theta}}(\mathbf{x}_i)$$

– Loss function

$$\ell(\hat{\mathbf{y}}, \mathbf{y}_i) \in \mathbb{R}$$

## Gradients

**Backpropagation** can compute this gradient!

And it's a **special case of a more general algorithm** called reverse-mode automatic differentiation that can compute the gradient of any differentiable function efficiently!

opposite the gradient)

$$\boldsymbol{\theta}^{(t+1)} = \boldsymbol{\theta}^{(t)} - \eta_t \nabla \ell(f_{\boldsymbol{\theta}}(\mathbf{x}_i), \mathbf{y}_i)$$

## Goals for Today's Lecture

1. Explore a **new class of decision functions** (Neural Networks)
2. Consider **variants of this recipe** for training

2. CHOOSE each of these:

- Decision function

$$\hat{y} = f_{\theta}(x_i)$$

- Loss function

$$\ell(\hat{y}, y_i) \in \mathbb{R}$$

4. Train with SGD:

– Take small steps  
opposite the gradient)

$$\theta^{(t+1)} = \theta^{(t)} - \eta_t \nabla \ell(f_{\theta}(x_i), y_i)$$

$$y = h_{\theta}(\mathbf{x}) = \sigma(\boldsymbol{\theta}^T \mathbf{x})$$

where  $\sigma(a) = a$

Output

Input

...

$\theta_1$

$\theta_2$

$\theta_3$

$\theta_M$

$$y = h_{\theta}(x) = \sigma(\theta^T x)$$

where  $\sigma(a) = \frac{1}{1 + \exp(-a)}$

Output

Input

...

$\theta_1$

$\theta_2$

$\theta_3$

$\theta_M$

## Decision Functions

# Logistic Regression

$$y = h_{\theta}(x) = \sigma(\theta^T x)$$

$$\text{where } \sigma(a) = \frac{1}{1 + \exp(-a)}$$

Output

Input

$\theta_1$

$\theta_2$

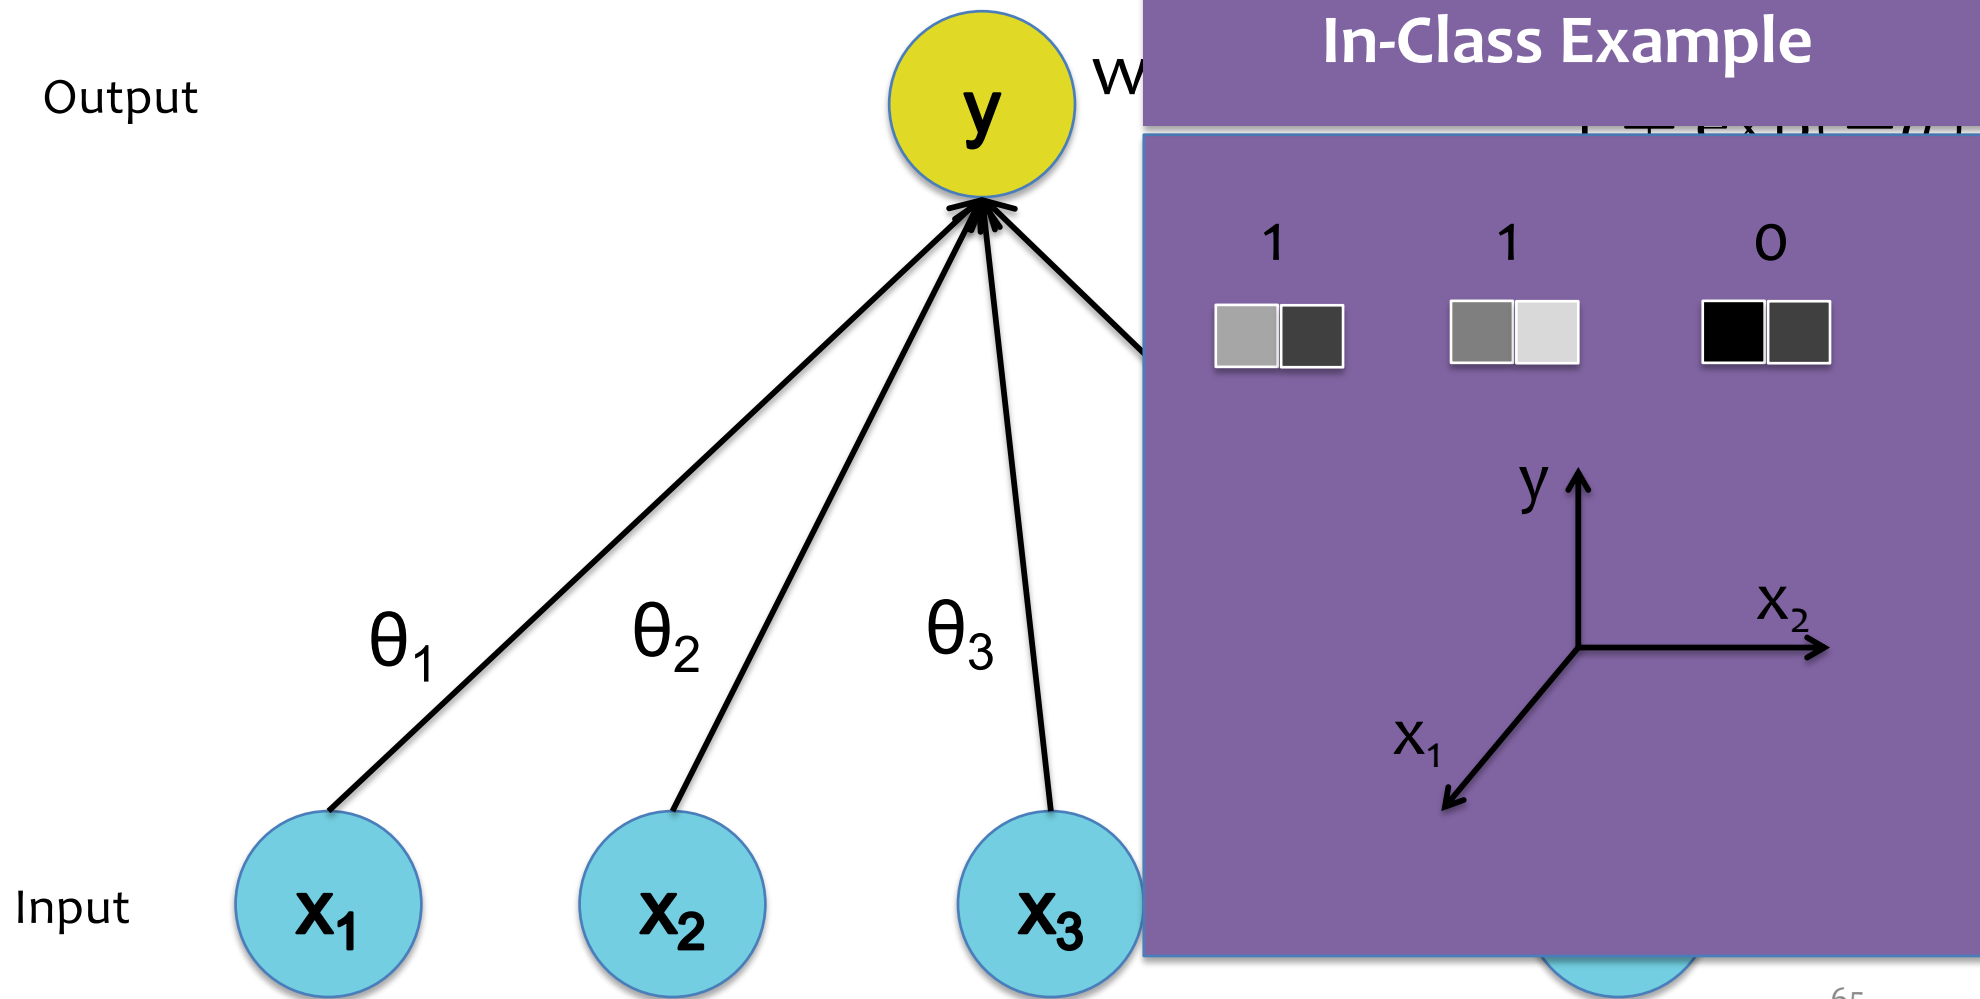

$\theta_3$

## Decision Functions

# Logistic Regression

$$y = h_{\theta}(x) = \sigma(\theta^T x)$$

$$y = h_{\theta}(\mathbf{x}) = \sigma(\theta^T \mathbf{x})$$

$$\text{where } \sigma(a) = \text{sign}(a)$$

Output

$\theta_1$

$\theta_2$

$\theta_3$

$\theta_M$

Input

...
