

15-441 Computer Networking

Lecture 17 – TCP & Congestion Control

Outline

- Congestion sources and collapse
- Congestion control basics
- TCP connection setup/data transfer
- TCP flow control

Lecture 17: 03-17-2005

2

Congestion

- Different sources compete for resources inside network
- Why is it a problem?
 - Sources are unaware of current state of resource
 - Sources are unaware of each other
- Manifestations:
 - Lost packets (buffer overflow at routers)
 - Long delays (queuing in router buffers)
 - Can result in throughput less than bottleneck link (1.5Mbps for the above topology) → a.k.a. congestion collapse

Lecture 17: 03-17-2005

3

Causes & Costs of Congestion

- Four senders – multihop paths
 - Timeout/retransmit
- Q: What happens as rate increases?

Lecture 17: 03-17-2005

4

Causes & Costs of Congestion

- When packet dropped, any “upstream transmission capacity used for that packet was wasted!

Lecture 17: 03-17-2005

5

Congestion Collapse

- Definition: *Increase in network load results in decrease of useful work done*
- Many possible causes
 - Spurious retransmissions of packets still in flight
 - Classical congestion collapse
 - How can this happen with packet conservation
 - Solution: better timers and TCP congestion control
- Undelivered packets
 - Packets consume resources and are dropped elsewhere in network
 - Solution: congestion control for ALL traffic

Lecture 17: 03-17-2005

6

Congestion Control and Avoidance

- A mechanism which:
 - Uses network resources efficiently
 - Preserves fair network resource allocation
 - Prevents or avoids collapse
- Congestion collapse is not just a theory
 - Has been frequently observed in many networks

Lecture 17: 03-17-2005

7

Approaches Towards Congestion Control

- Two broad approaches towards congestion control:
 - **End-end congestion control:**
 - No explicit feedback from network
 - Congestion inferred from end-system observed loss, delay
 - Approach taken by TCP
 - **Network-assisted congestion control:**
 - Routers provide feedback to end systems
 - Single bit indicating congestion (SNA, DECbit, TCP/IP ECN, ATM)
 - Explicit rate sender should send at
 - Problem: makes routers complicated

Lecture 17: 03-17-2005

8

Example: TCP Congestion Control

- Very simple mechanisms in network
 - FIFO scheduling with shared buffer pool
 - Feedback through packet drops
- TCP interprets packet drops as signs of congestion and slows down
 - This is an assumption: packet drops are not a sign of congestion in all networks
 - E.g. wireless networks
- Periodically probes the network to check whether more bandwidth has become available.

Lecture 17: 03-17-2005

9

Outline

- Congestion sources and collapse
- Congestion control basics
- TCP connection setup/data transfer
- TCP flow control

Lecture 17: 03-17-2005

10

Objectives

- Simple router behavior
- Distributedness
- Efficiency: $X = \sum x_i(t)$
- Fairness: $(\sum x_i)^2 / n(\sum x_i^2)$
 - What are the important properties of this function?
- Convergence: control system must be stable

Lecture 17: 03-17-2005

11

Basic Control Model

- Reduce speed when congestion is perceived
 - How is congestion signaled?
 - Either mark or drop packets
 - How much to reduce?
- Increase speed otherwise
 - Probe for available bandwidth – how?

Lecture 17: 03-17-2005

12

Linear Control

- Many different possibilities for reaction to congestion and probing
 - Examine simple linear controls
 - $\text{Window}(t + 1) = a + b \text{ Window}(t)$
 - Different a_i/b_i for increase and a_d/b_d for decrease
- Supports various reaction to signals
 - Increase/decrease additively
 - Increased/decrease multiplicatively
 - Which of the four combinations is optimal?

Lecture 17: 03-17-2005

13

Phase Plots

- Simple way to visualize behavior of competing connections over time

Lecture 17: 03-17-2005

14

Phase Plots

- What are desirable properties?
- What if flows are not equal?

Lecture 17: 03-17-2005

15

Additive Increase/Decrease

- Both x_1 and x_2 increase/ decrease by the same amount over time
 - Additive increase improves fairness and additive decrease reduces fairness

Lecture 17: 03-17-2005

16

Multiplicative Increase/Decrease

- Both x_1 and x_2 increase by the same factor over time
- Extension from origin – constant fairness

Lecture 17: 03-17-2005

17

Convergence to Efficiency

Lecture 17: 03-17-2005

18

Distributed Convergence to Efficiency

Lecture 17: 03-17-2005

19

Convergence to Fairness

Lecture 17: 03-17-2005

20

Convergence to Efficiency & Fairness

- Intersection of valid regions
- For decrease: $a=0$ & $b < 1$

Lecture 17: 03-17-2005

21

What is the Right Choice?

- Constraints limit us to AIMD
 - Can have multiplicative term in increase (MAIMD)
 - AIMD moves towards optimal point

Lecture 17: 03-17-2005

22

Good Ideas So Far...

- Flow control
 - Stop & wait
 - Parallel stop & wait
 - Sliding window
- Loss recovery
 - Timeouts
 - Acknowledgement-driven recovery (selective repeat or cumulative acknowledgement)
- Congestion control
 - AIMD $\rightarrow$ fairness and efficiency
- How does TCP actually implement these?

Lecture 17: 03-17-2005

23

Outline

- Congestion sources and collapse
- Congestion control basics
- TCP connection setup/data transfer
- TCP flow control

Lecture 17: 03-17-2005

24

Sequence Number Space

- Each byte in byte stream is numbered.
 - 32 bit value
 - Wraps around
 - Initial values selected at start up time
- TCP breaks up the byte stream in packets.
 - Packet size is limited to the Maximum Segment Size
- Each packet has a sequence number.
 - Indicates where it fits in the byte stream

Lecture 17: 03-17-2005

25

Establishing Connection: Three-Way handshake

- Each side notifies other of starting sequence number it will use for sending
 - Why not simply chose 0?
 - Must avoid overlap with earlier incarnation
 - Security issues
- Each side acknowledges other's sequence number
 - SYN-ACK: Acknowledge sequence number + 1
- Can combine second SYN with first ACK

Lecture 17: 03-17-2005

26

TCP Connection Setup Example

```
09:23:33.042318 IP 128.2.222.198.3123 > 192.216.219.96.80: S
4019802004:4019802004(0) win 65535 <mss 1260,nop,nop,sackOK>
(DF)
```

```
09:23:33.118329 IP 192.216.219.96.80 > 128.2.222.198.3123: S
3428951569:3428951569(0) ack 4019802005 win 5840 <mss
1460,nop,nop,sackOK> (DF)
```

```
09:23:33.118405 IP 128.2.222.198.3123 > 192.216.219.96.80: . ack
3428951570 win 65535 (DF)
```

- Client SYN
 - SeqC: Seq. #4019802004, window 65535, max. seg. 1260
- Server SYN-ACK+SYN
 - Receive: #4019802005 (= SeqC+1)
 - SeqS: Seq. #3428951569, window 5840, max. seg. 1460
- Client SYN-ACK
 - Receive: #3428951570 (= SeqS+1)

Lecture 17: 03-17-2005

27

TCP State Diagram: Connection Setup

Lecture 17: 03-17-2005

28

Tearing Down Connection

- Either side can initiate tear down
 - Send FIN signal
 - "I'm not going to send any more data"
- Other side can continue sending data
 - Half open connection
 - Must continue to acknowledge
- Acknowledging FIN
 - Acknowledge last sequence number + 1

Lecture 17: 03-17-2005

29

TCP Connection Teardown Example

```

09:54:17.585396 IP 128.2.222.198.4474 > 128.2.210.194.6616: F
1489294581:1489294581(0) ack 1909787689 win 65434 (DF)

09:54:17.585732 IP 128.2.210.194.6616 > 128.2.222.198.4474: F
1909787689:1909787689(0) ack 1489294582 win 5840 (DF)

09:54:17.585764 IP 128.2.222.198.4474 > 128.2.210.194.6616: . ack
1909787690 win 65434 (DF)
    
```

- Session
 - Echo client on 128.2.222.198, server on 128.2.210.194
- Client FIN
 - SeqC: 1489294581
- Server ACK + FIN
 - Ack: 1489294582 (= SeqC+1)
 - SeqS: 1909787689
- Client ACK
 - Ack: 1909787690 (= SeqS+1)

Lecture 17: 03-17-2005

30

State Diagram: Connection Tear-down

Lecture 17: 03-17-2005

31

Outline

- Congestion sources and collapse
- Congestion control basics
- TCP connection setup/data transfer
- TCP flow control

Lecture 17: 03-17-2005

32

Sequence Numbers

- 32 Bits, Unsigned
 - Circular Comparison

- Why So Big?
 - For sliding window, must have $|\text{Sequence Space}| > |\text{Sending Window}| + |\text{Receiving Window}|$
 - No problem
 - Also, want to guard against stray packets
 - With IP, packets have maximum lifetime of 120s
 - Sequence number would wrap around in this time at 286MB/s

Lecture 17: 03-17-2005

33

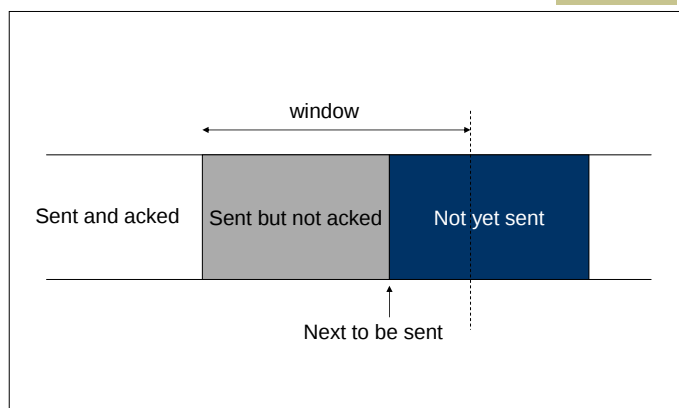

TCP Flow Control

- TCP is a sliding window protocol
 - For window size n , can send up to n bytes without receiving an acknowledgement
 - When the data is acknowledged then the window slides forward
- Each packet advertises a window size
 - Indicates number of bytes the receiver has space for
- Original TCP always sent entire window
 - Congestion control now limits this

Lecture 17: 03-17-2005

34

Window Flow Control: Send Side

Lecture 17: 03-17-2005

35

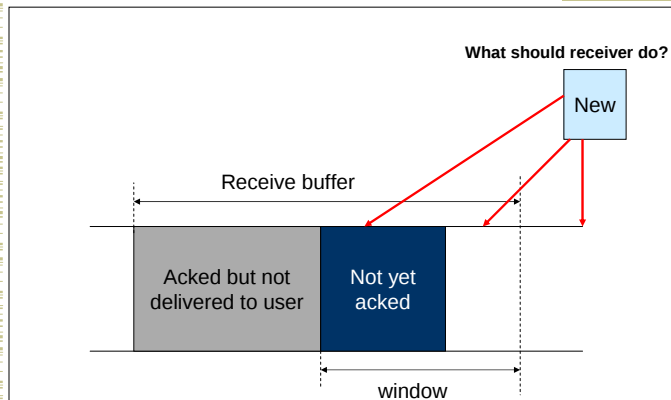

Window Flow Control: Send Side

Lecture 17: 03-17-2005

36

Window Flow Control: Receive Side

Lecture 17: 03-17-2005

37

TCP Persist

- What happens if window is 0?
 - Receiver updates window when application reads data
 - What if this update is lost?
- TCP Persist state
 - Sender periodically sends 1 byte packets
 - Receiver responds with ACK even if it can't store the packet

Lecture 17: 03-17-2005

38

Performance Considerations

- The window size can be controlled by receiving application
 - Can change the socket buffer size from a default (e.g. 8Kbytes) to a maximum value (e.g. 64 Kbytes)
- The window size field in the TCP header limits the window that the receiver can advertise
 - 16 bits $\rightarrow$ 64 KBytes
 - 10 msec RTT $\rightarrow$ 51 Mbit/second
 - 100 msec RTT $\rightarrow$ 5 Mbit/second
 - TCP options to get around 64KB limit

Lecture 17: 03-17-2005

39

Important Lessons

- Why is congestion control needed?
- How to evaluate congestion control algorithms?
 - Why is AIMD the right choice for congestion control?
- TCP state diagram $\rightarrow$ setup/teardown
- TCP flow control
 - Sliding window $\rightarrow$ mapping to packet headers
 - 32bit sequence numbers (bytes)

Lecture 17: 03-17-2005

40

EXTRA SLIDES

The rest of the slides are FYI

Detecting Half-open Connections

TCP A

TCP B

- | | | |
|---------------------------------------|---|-------------------------|
| 1. (CRASH) | | (send 300, receive 100) |
| 2. CLOSED | | ESTABLISHED |
| 3. SYN-SENT → <SEQ=400><CTL=SYN> | → | (??) |
| 4. (!!) ← <SEQ=300><ACK=100><CTL=ACK> | ← | ESTABLISHED |
| 5. SYN-SENT → <SEQ=100><CTL=RST> | → | (Abort!!) |
| 6. SYN-SENT | | CLOSED |
| 7. SYN-SENT → <SEQ=400><CTL=SYN> | → | |

Lecture 17: 03-17-2005

42

Other Congestion Collapse Causes

- Fragments
 - Mismatch of transmission and retransmission units
- Solutions
 - Make network drop all fragments of a packet (early packet discard in ATM)
 - Do path MTU discovery
- Control traffic
 - Large percentage of traffic is for control
 - Headers, routing messages, DNS, etc.
- Stale or unwanted packets
 - Packets that are delayed on long queues
 - "Push" data that is never used

Lecture 17: 03-17-2005

43
